Geodimeter® CU

2

Geodimeter® CU

User Guide Part 2

Trimble®

Release Notice

This is the June 2005 release version 03.00 of the Geodimeter CU User Guide part 2, part number 571702001. It applies to the Geodimeter CU Control Unit

The following limited warranties give you specific legal rights. You may have others, which vary from state/jurisdiction to state/jurisdiction.

Hardware Limited Warranty

Trimble Navigation Limited warrants that this hardware product (the "Product") will perform substantially in accordance with published specifications and be substantially free of defects in material and workmanship for a period of one (1) year starting from the date of delivery. The warranty set forth in this paragraph shall not apply to software products.

Software License, Limited Warranty

This Trimble software product, whether provided as a stand-alone computer software product, built into hardware circuitry as firmware, embedded in flash memory, or stored on magnetic or other media, (the "Software") is licensed and not sold, and its use is governed by the terms of the relevant End User License Agreement ("EULA") included with the Software. In the absence of a separate EULA included with the Software providing different limited warranty terms, exclusions and limitations, the following terms and conditions shall apply. Trimble warrants that this Trimble Software product will substantially conform to Trimble's applicable published specifications for the Software for a period of ninety (90) days, starting from the date of delivery.

Warranty Remedies

Trimble's sole liability and your exclusive remedy under the warranties set forth above shall be, at Trimble's option, to repair or replace any Product or Software that fails to conform to such warranty ("Nonconforming Product") or refund the purchase price paid by you for any such Nonconforming Product, upon your return of any Nonconforming Product to Trimble in accordance with Trimble's standard return material authorization procedures.

Warranty Exclusions and Disclaimer

These warranties shall be applied only in the event and to the extent that the Products and Software are properly and correctly installed, configured, interfaced, maintained, stored, and operated in accordance with Trimble's relevant operator's manual and specifications, and; (ii) the Products and Software are not modified or misused. The preceding warranties shall not apply to, and Trimble shall not be responsible for defects or performance problems resulting from (i) the combination or utilization of the Product or Software with hardware or software products, information, data, systems, interfacing or devices not made, supplied or specified by Trimble; (ii) the operation of the Product or Software under any specification other than, or in addition to, Trimble's standard specifications for its products; (iii) the unauthorized modification or use of the Product or Software; (iv) damage caused by accident, lightning or other electrical discharge, fresh or salt water immersion or spray; or (v) normal wear and tear on consumable parts (e.g., batteries). Trimble does not warrant or guarantee the results obtained through the use of the Product.

THE WARRANTIES ABOVE STATE TRIMBLE'S ENTIRE LIABILITY, AND YOUR EXCLUSIVE REMEDIES, RELATING TO PERFORMANCE OF THE PRODUCTS AND SOFTWARE. EXCEPT AS OTHERWISE EXPRESSLY PROVIDED HEREIN, THE PRODUCTS, SOFTWARE, AND ACCOMPANYING DOCUMENTATION AND MATERIALS ARE PROVIDED "AS-IS" AND WITHOUT EXPRESS OR IMPLIED WARRANTY OF ANY KIND BY EITHER TRIMBLE NAVIGATION LIMITED OR ANYONE WHO HAS BEEN INVOLVED IN ITS CREATION, PRODUCTION, INSTALLATION, OR DISTRIBUTION INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, TITLE, AND NONINFRINGEMENT. THE STATED EXPRESS WARRANTIES ARE IN LIEU OF ALL OBLIGATIONS OR LIABILITIES ON THE PART OF TRIMBLE ARISING OUT OF, OR IN CONNECTION WITH, ANY PRODUCTS OR SOFTWARE. SOME STATES AND JURISDICTIONS DO NOT ALLOW LIMITATIONS ON DURATION OR THE EXCLUSION OF AN IMPLIED WARRANTY, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

TRIMBLE NAVIGATION LIMITED IS NOT RESPONSIBLE FOR THE OPERATION OR FAILURE OF OPERATION OF GPS SATELLITES OR THE AVAILABILITY OF GPS SATELLITE SIGNALS.

Limitation of Liability

TRIMBLE'S ENTIRE LIABILITY UNDER ANY PROVISION HEREIN SHALL BE LIMITED TO THE AMOUNT PAID BY YOU FOR THE PRODUCT OR SOFTWARE LICENSE. TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT SHALL TRIMBLE OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES WHATSOEVER UNDER ANY CIRCUMSTANCE OR LEGAL THEORY RELATING IN ANY WAY TO THE PRODUCTS, SOFTWARE AND ACCOMPANYING DOCUMENTATION AND MATERIALS, (INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, OR ANY OTHER PECUNIARY LOSS), REGARDLESS WHETHER TRIMBLE HAS BEEN ADVISED OF THE POSSIBILITY OF ANY SUCH LOSS AND REGARDLESS OF THE COURSE OF DEALING WHICH DEVELOPS OR HAS DEVELOPED BETWEEN YOU AND TRIMBLE. BECAUSE SOME STATES AND JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

NOT WITHSTANDING THE ABOVE, IF YOU PURCHASED THIS PRODUCT OR SOFTWARE IN THE EUROPEAN UNION, THE ABOVE WARRANTY PROVISIONS MAY NOT APPLY. PLEASE CONTACT YOUR DEALER FOR APPLICABLE WARRANTY INFORMATION.

Notices

Class B Statement – Notice to Users. This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communication. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

– Reorient or relocate the receiving antenna.

– Increase the separation between the equipment and the receiver.
– Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
– Consult the dealer or an experienced radio/TV technician for help.

Changes and modifications not expressly approved by the manufacturer or registrant of this equipment can void your authority to operate this equipment under Federal Communications Commission rules.

Welcome to Geodimeter CU

This manual will describe the different softwares that can be installed in Geodimeter® CU.

Since Geodimeter CU have flexible design it is possible to upgrade software, memory units and other accessories. The various softwares makes it possible to customize your system to your own way of working.

The built in two-way serial communication enables you to connect external memory units and computers to the instrument.

About this manual

The contents of this manual are as follows:

Part 2

Includes available softwares and contains step by step instructions on how to use each software.

Comments about this manual

If you or your colleagues have any comments on this manual, we would be grateful to hear from you. Please write to:

Software

Introduction

Geodimeter CU can be equipped with a number of different software in order to make the surveying work more efficient. This manual will describe the different softwares that are available, how they are operated and what you can achieve by using them.

Choose Program

Both the numeric- and the alphanumeric keyboard are equipped with a program key, here after referred to as the PRG-key.

PRG Program key

By pressing this key you can start any program that are installed in your instrument. There are two ways to choose a program; short press and long press on the PRG-key. On the next side we will describe the two different methods.

Short Press

With a short press on the PRG-key you will get the following display appearance:

```
STD    P0   10:16

Program=20
```
Key in the desired program number and press enter to confirm the choice, e.g. 20 ENT will enter program number 20, Station Establishment.

Long Press

With a long press on the PRG-key you step to the program menu. Here you can display all the available programs. Any program that are available but not installed in your CU is displayed with two brackets,( ).

PRG P20 10:16	<-Current library and program no
460 582-09	<-Instrument model and program ver
Stn establ.	<-Current program name
Dir ← → Exit	<-Key functions

Key functions:

Dir: Step between the U.D.S- and PRG-library

← →   Step backward/forward in chosen library.

Exit/MNU: Exit without starting any program

ENT: Start the chosen program

Note –   If the arrowkey is held depressed you will automatically step to the next/previous program without having to press the key repeatedly.

User Defined Storage of Control Data in the Field Calculation Programs

It is possible to define what results to be stored in the JOB file using the field calculation programs. In some programs you can only add information and in some you can define data all by yourself.

See page 1-7 for a complete list of the programs that can be Configured. When you start any of these programs by the program library you will get the following display appearance:
```
        P23  14:17
1 Run
2 Config
```
<-Current program no and time
<-Start program without any config.
<-Configure program

Note – When pressing the PRG-key on the control unit in local mode you can only access this menu.

Choose 1 Run to start the program without any configuration or press 2 to configure the program. Press the CL-key to exit from this menu and step to the current program.

Configure the user defined output table

When you press 2 you will get the following display appearance:
```
        P23    14:17
1 Exit
2 View table
3 Enter user tbl
```
<-Current program no and time
<-Step to the previous menu
<-View the current output table
<-Configure table

ENT

Note – When pressing the PRG-key on the control unit in local mode you can only access this menu.

Choose one of the alternatives (press ENT for more) or press 1 or the CL-key to step to the previous menu.
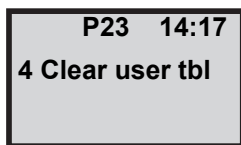

```
       P23    14:17

4 Clear user tbl
```
<-Clear the current user table

How to use

2 View table

If you press 2 you will view the current output table:

P23 14:17	<-Current program no and time
Def. tbl pos 1	<-Table position
Label: Pno	<-Lable
more?	<-View more?

This is position 1 in the output table. Press YES or ENT to view the next position or step to the previous menu with NO. When all positions in the output table are viewed you will return to the previous menu.

3 Enter user table

If you press 3 you will enter the output table:

P23 14:17	<-Current program no and time
User tbl pos 1	<-Table position
Label no=_	<-Lable

This position 1 in the output table. Enter the first label no and press ENT. Press only ENT when you are finished. The new output table will be default.

4 Clear user table

If you press 4 you will get the following display appearance:

```
          P23    14:17
  Clear user tbl
  Are you sure?
```
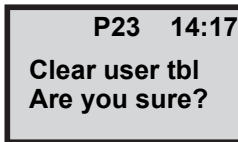

Press YES or ENT to delete the current output table or press NO to cancel.

Note –   When you delete the output table the standard output table will be default.

Which data can be stored in a specific program?

On the next page is a list over the labels that are always stored in a specific program (Always) and which labels that the operator can choose whether to include or not (Standard). E.g. in program P24, RefLine, the Reference point data (labels 5, 37, 38…) are always stored. The operator can by configurating the program via the configuration menu at startup choose whether to include any of the standard labels or not, e.g. measured point data (5, 6, 37…). As default when no configuration has been made, all standard will be stored.

Program Configuration List

SetOut - P23	Always=cannot be changed Standard=can be changed
Always:	None
Standard:	5, 40, 41, 42*
RefLine - P24 **(Measure)**	
Always:	(5, 37, 38, 39, 5, 37, 38, 39, 44)¤
Standard:	5, 6*, 37, 38, 39*, 72, 73, 42*
(SetOut with Radofs/RTofs)	
Always:	(5, 37, 38, 39, 5, 37, 38, 39)¤
Standard:	5, 72, 73, 42*
(SetOut with coordinates)	
Always:	(5, 37, 38, 39, 5, 37, 38, 39)¤
Standard:	Same as P23, modified by config P23.
DistOb - P26	
Always:	5, 5, 7, 11, 10, 14None
Standard:	
Obstructed Point - P28	
Always:	20, distBC, Pno, 37, 38, 39, 7, 11, 10, 14
Standard:	Data for point A and B
RoadLine - P29 **(SetOut)**	
Always:	None
Standard:	80, 83, 40, 41, 42*, 39*
(Measure)	
Always:	None
Standard:	80, 83, 4, 37, 38, 39*

RoadLine - P39	
(SetOut)	
Always:	None
Standard:	80, 83, 40, 41, 42*, 39*
(Measure)	
Always:	None
Standard:	80, 83, 4, 37, 38, 39*

*These labels (height) are only stored if height measurement has been included in the station establishment.

¤These labels are only stored if using a known reference line.

Edit & View

In General

With EDIT installed in your Geodimeter CU, it is possible to carry out editing of the data within the recording device, External memory or Geodat, directly from the keyboard of the Geodimeter CU. Viewing of the data, before editing, can be done with the help of VIEW, which is automatically included in EDIT software additional option.

You can step through files, search for, delete, insert and change data. EDIT is selected directly from the main menu of the instrument, option 2 - EDITOR. This option is directly linked to a sub-menu which allows you to edit data in either the external memory (Geodat) or the internal memory. The editing features of this software option are menu driven with the command options shown on the bottom line of the display, which are in turn directly placed above the relevant operating key of the small keyboard. The various operations are selected by pressing the relevant key. The keyboard is reconfigured to the actual chosen mode and when the bottom line is not visible, the key continues to operate with its original function.

How to use

The program consists of three modes of operation, each with its own menu. The modes are 1 View, 2 Edit and 3 Directory. To enter the editor, follow the instructions below.

Startup

Enter the program via menu 2.

```
STD   P0    11:41
HA: 41.9087
VA: 23.9876
```

MNU   2

In which memory unit do you want to work, 1 the internal memory or 2 an external memory.

```
Memory      11:41
1 Imem
2 Xmem
```

2

You are now displayed the remaining memory capacity (total number of Kbytes free). Press ENT to step further.

```
Imem Area  11:41

31.675 Kby free
```

ENT

View

In this mode you can select which file you want to view. Her you can also view the functions to step forward or backwards in the file.

Imem Area 14:50

<- Current memory unit and file type

Area=6   <- Current file number
Beg End <--- -->   <- Command line

Beg   Jump to the beginning of the file.

End   Jump to the end of the file.

<-   Step to the previous line in the file.

->   Step to the next line in the file.

Note – arrowkeys
If the arrowkey is held depressed you will automatically step to the next/previous line without having to press the key repeatedly.

ENT   Press this key to step to the next
mode=EDIT

MNU   Press this key to return to the main menu.

Edit

In this mode you can find, change, insert and delete data in
the file you have chosen.

```
Imem Area  14:50

Area=6
Del Ins Chg Find
```
<- Current memory unit and file type

<- Current file number
<- Command line

Del   Delete current label and prompt or
complete file. Deletion of complete files
can be executed when the prompt is a
filename e.g. Job No. To avoid accidental
file delection a "yes/no" prompt must be
answered.

Ins   Insert a label and prompt in front of the one
displayed.

Chg   Change data relating to displayed label.

Find   Search for label and label and prompt.
When the data value for a prompt is keyed
in, the first prompt with that value is
displayed.

ENT   Press this key to go to the next mode=
DIRECTORY

MNU   Press this key to return to the main menu

Directory

In this mode you can select what type of file you want to view, Area- or Job-file.

Imem Area 14:50	<- Current memory unit and file type
Area=6	<- Current file number
Dir <--- --> Exit	<- Command line

Dir: Switch between the Job and the Area file directory

<-:   Show the name of the file following the one now displayed

->:   Show the name of the file in front of the one now displayed

Exit: Exit to the main menu

Note – arrowkeys
If the arrowkey is held depressed you will automatically increase/decrease the file number without having to press the key repeatedly.

ENT   Press this key to go to the next mode=VIEW. If the current file is not visible in the display a prompt for change to file? is seen. In the case of answering YES the old file is closed and the new is opened. Answering NO will lead you back to VIEW without file change.

MNU   Press this key to return to the main menu.

Examples

In order to fully appreciate the operating flexibility of EDIT, we will now run through a few examples. It is assumed that before you start the editing examples you should prepare the instrument as follows: Set up the instrument and survey in a few points using one of your own specially designed UDS´s and store them.

Change Data/Replace With new Data

After registration of a point you realise that the last SH of 0.8m for Pno 17 was wrong. First follow the startup instruction described on page 4.2.3. In this example we choose the external memory.

```
UDS  P10  16:05

Step:1
Pno=18
```

```
MNU    2
```

As you know that it was the last point you first press End to go to the end of the Jobfile. Then you can use the >-=(REG-numeric keyboard or STD-alphanumeric) to step back to the wrong SH.

```
Imem Job 10:16

Job no=1
Beg End <-- -->
```

```
✉  REG  or  STD
```

Now press the ENT key to step to the EDIT mode.

```
Imem Job 10:16

SH=0.8
Beg End <-- -->
```

ENT

You are now in EDIT mode and you want to change the SH value from 0.8m to 0.5m. Press therefore the CHG key=(REG-numeric keyboard or STD-alphanumeric).

```
Imem Job 16:05

SH=0.8
Del Ins Chg Find
```

REG or **STD**

Key in 0.5 to overwrite the wrongly stored value of 0.8 and accept with ENT. Press only ENT if no change is to be made.

```
Imem Job 16:05

Change: SH
Data=.8
```

0 **.** **5** **ENT**

In order to see that the changed SH value has been stored in the correct place use the arrowkeys.

```
Imem Job 16:05

SH=0.5
Beg End <-- -->
```

MNU **MNU**

Press MNU twice to return to the UDS-sequence.

```
UDS    P10 16:05

Step:1
Pno=18
```

Find and Change Data

Follow the startup instruction described on page 2-3. In this example we choose the internal memory.

```
STD    P0  17:55

HA: 355.3245
VA: 101.4252
```

MNU   2

You are now in the VIEW mode. Press ENT to go to the EDIT mode.

```
Imem Job 16:05

Job no=12
Beg End <-- -->
```

ENT

You wish to find the point No 204 to change its SH to the correct value 1.7. Press the FIND key=(A/M-numeric keyboard, TRK-alphanumeric).

```
Imem Job 16:05

Job no=12
Del Ins Chg Find
```

A/M or TRK

Note – Find If wishing to find data try always to be at the front (top) or back (end) of the data file before the search begins. If you go past a value and try to find it, an error will be given, i.e. INFO 32.

*If wishing to find data which belongs to one
particular label, the find routine will jump
consecutively through the file from that particular
label No. to the next one, jumping the other labels
in between.*

In order to first find the point No you first have to choose the
label No for Pno. Key in 5 and ENT.

```
Imem Job 16:05

Find
Label=
```

`5` `ENT`

Here the Pno is being asked for. Key in 204 and ENT.

```
Imem Job 16:05

Find: Pno
Data=_
```

`2` `0` `4` `ENT`

You know that in the UDS you are using SH lies 2 steps
after Pno 204. Press the --> key (A/M-numeric keyboard,
TRK-alphanumeric) twice or keep it depressed until SH is
found.

```
Imem Job 16:05

Pno=204
Beg End <-- -->
```

`A/M` or `TRK`

In order to change the SH from.5 to 1.7 press the CHG-key=(REG-numeric keyboard, STD-alphanumeric).

```
Imem Job 16:05

SH=. 5
Beg End <-- -->
```

REG or **STD**

Overwrite the displayed data. Key in 1.7 and press ENT.

```
Imem Job 16:05

Change: SH
Data=. 5
```

1 **·** **7** **ENT**

The correct SH is now stored in the memory device.

Press MNU twice to return to the theodolite mode.

```
Imem Job 16:05

SH=1.7
Beg End <-- -->
```

MNU **MNU**

```
STD  P0     17:55

HA: 355.3245
VA: 101.4252
```

Delete/Insert

Follow the startup instruction described on page 2-3. In this example we choose the internal memory.

```
STD P0    17:55

HA: 355.3245
VA: 101.4252
```

MNU   **2**

Your general data lies at the beginning of your Job data file, so you need only come to DATE=2001.0506

```
Imem Job 16:05

Job no=12
Beg End <-- -->
```

A/M or **TRK**

You wish to delete this completely and replace it with time. Press ENT to step to the EDIT mode.

```
Imem Job 16:05

Date=2001.0506
Beg End <-- -->
```

ENT

Now delete Date by pressing DEL.

```
Imem Job 16:05

Date=2001.0506
Del Ins Chg Find
```

Your next prompt is now displayed. Return to the EDIT mode by pressing ENT.

```
Imem Job 16:05

Stn=101
Beg End <-- -->
```

ENT

Now insert in front of Stn=101. Press INS.

```
Imem Job 16:05

Stn=101
Del Ins Chg Find
```

You shall insert temp. first. Label No. for temp. is 52. Key in 52 and ENT.

```
Imem Job 16:05

Insert
Label=_
```

5   **2**   **ENT**

The temp. which you wish to record was the temp. at the time of the actual measurements. Key in 23 and ENT:

```
Imem Job 16:05

Insert: Temp
Data=_
```

2 **3** **ENT**

To check that the inserted temp. data has been inserted into the correct place press the arrow keys.

```
Imem Job 16:05

Temp=23
Beg End <-- -->
```

REG or **TRK**

Make sure you have Stn=101 in display before inserting the pressure label. Then press ENT to step to the EDIT mode.

```
Imem Job 16:05

Stn=101
Beg End <-- -->
```

ENT

Now choose the Ins function to insert the missing pressure data. Press Ins.

```
Imem Job 16:05

Stn=101
Del Ins Chg Find
```

The label No. for pressure is 74. Key in 74 and press ENT.

```
Imem Job 16:05

Insert
Label=_
```

7 **4** **ENT**

The pressure at the time of the measurements was 755 mmHg. Key in 755 and press ENT.

```
Imem Job 16:05

Insert: Press
Data=755
```

7 **5** **5** **ENT**

Temp. and Pressure values are now stored in the memory device before Stn.name in the Job no file. Use the

arrowkeys to check the position of the prompts and their values.

```
Imem Job 16:05

Press=755
Beg End <-- -->
```

Change From one File to Another

Follow the startup instruction described on page 2-3. In this example we choose the external memory. Then enter the DIRECTORY mode.

Here you can page through your Job/Area files. At the moment you are in the Job file directory. Press <- or -> to page through your list of stored Job files.

```
Imem Job 16:05

Job no=12
Dir <-- --> Exit
```

When you come to the next Job No file you are looking for, press ENT.

```
Imem Job 16:05

Job no=13
Beg End <-- -->
```

```
ENT
```

Is this the file to which you want to change? Answer YES or NO to confirm. Press YES.

```
Imem Job 16:05

Change to this?
Job no=13
```

```
YES
```

You are now in the VIEW mode at the top (beginning) of Job file No. 13. Press ENT if you want to EDIT or use the arrowkeys to view the file.

```
Imem Job 16:05

Job no=13
Beg End <-- -->
```

The above example can of course be done with Area files if you had pressed the Area option in the first display shown on this page.

Clear Memory

Follow the startup instruction described on page 2-3. In this example we choose the external memory. Then enter the EDIT mode.

In order to delete Job no 13 from the memory press DEL.

```
Imem Job 16:05

Job no=13
Del Ins Chg Find
```

Here you have a chance to change your mind about total erasure of the file. Press YES or NO.

```
Imem Job 16:05

Are you sure?
```

YES

Job no 13 is now deleted from the memory.

```
Imem Job 16:05

Job no=0
Beg End <-- -->
```

View

View enables you to retrieve and check data stored in either the external memory (card memory) and/or the internal memory of Geodimeter CU. Checking of data is limited to the Job No. file in which you are presently working. To view Job files other than the one in which you are presently working, see Directory, page 2-6.

The program consists of two modes of operation, 1 View and 2 Directory, which are described on page 2-6 and page 2-6 To step between the two modes use the ENT-key. To start the program follow the startup instruction on page 2-3

3

P20 Station Establishment

In General

Station Establishment (P20) is a basic software package for Geodimeter CU field calculation programs. This program is used to calculate and store instrument setup data which is required for some of the field calc.programs. The programs that follow P20 are SetOut, RoadLine and RefLine (see figure 3.1). If you try to activate any of these programs without first establishing your station, you are taken directly to P20.
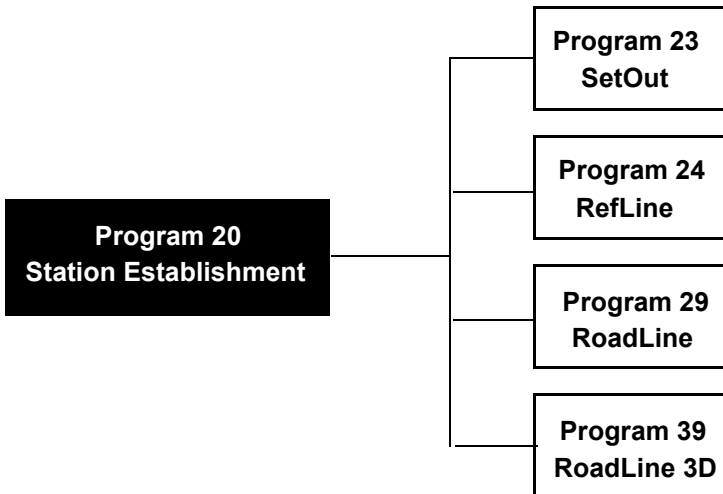

Figure 3.1   Station establishment is necessary for running the above programs.

The program is divided into three main functions:

1 Known station   for station establishment when the coordinates of your station point and reference object are known.

2 Free station   for free station establishment using 2-8 points whose coordinates are known.

3 Known station+   for station establishment when the coordinates of your station point and up to ten reference objects are known.

Preparations

Before station establishment can take place, the coordinates and point numbers must be stored in an Area file – either in the internal memory or in an external memory such as Card memory or – using P43 (Enter Coordinates) or downloaded from a computer. These coordinates are then used in P20 when you retrieve the correct Area file and Pno.

Known Station & Known Station+

When establishing a station at a known point, you will only need the point numbers for your station point and reference object. The instrument will then calculate bearing and distance automatically. To increase the accuracy of the bearing a new routine called "Known Station+" has been implemented in the instrument. By using this function you can measure to up to ten reference objects and also obtain a standard deviation (S_dev). See more about this routine on page 3-15. When running Known Station in P20, you decide whether or not elevations are to be used in other calculation programs. Here you also indicate in what Job file station data and possibly other data to be calculated later will be stored, and in what Area file the coordinates are stored. See on page 3-29 what is stored in the selected Job file when a Known Station has been established.

Free station

You choose free station establishment when the station point is unknown – that is, N, E and possibly ELE will have to be calculated. This function allows free establishment in which several different combinations of objects, angles and distances can be used. The calculation is a combination of resection and triangulation. If you make several measurements, you obtain not only the mean value but also the standard deviation (S_dev). The calculation is done according to the least square adjustment method. If good results are to be obtained using this method, it is important that the traverses and networks are of high quality. For this reason we have provided the Free Station routine with a function called Config. (configuration). This allows you to use factors such as the scale factor (stored under label = 43), weight factors to weight your points with regard to the distance from your free station to the known point (used mainly in Germany), and also to create a point list in which all measured data for each individual measured point can be made available for editing and possible recalculation. In the example on page 3-31 we have chosen not to use Config. but to treat it separately on page 3-50.

Free station establishment can be done with a large number of different combinations of points, angles, and distances (see figure 3.2)

Free station establishment using 3-10 known points, the following combinations are possible:

1. Angles distances

2. Only angles. But note that three points alone will not provide enough data to be able to calculate an optimal solution – that is, they will not give a standard deviation.

Note – *If only 3 angles are used, try to establish within the "triangle" in order to avoid the "dangerous circle".*
Figure 3.2   Free station establishment

In free station establishment with two known points, the following is valid:

1. Angles and distances.
Figure 3.3   Free station establishment with 2 known points

Eccentric Station

With Eccentric station distance and angles will be measured to one point and to the second point only angles will be measured (like a church tower).

1. Always measure the points clockwise.

2. Only two points can be used.

3. The HA difference must be less than 200 grads (180°).

4. A distance can only be measured towards one of the objects.

How to use

The examples that follow deal with three kinds of station establishment: Known Station, Known Station+ and Free Station. It is assumed that you are familiar with the operation of your Trimble instrument. Switch on the instrument and go step by step through program 0 until you are in theodolite position – that is, HA and VA are shown on the display.

Known Station

The instrument is now in theodolite position. Select P20 (Station Establishment).

```
STD    P0   10:16
HA: 234.5678
VA:   92.5545
```

```
PRG    2    0    ENT
```

In this first example we will establish a station with a known point and reference object. These are stored as Pno and coordinates in an Area file, using P43 (Enter Coordinates). Pno 1101 is our station point and Pno 1102 is our reference object.
Now we will select option 1, Known Station.

```
Stn.estab    10:17
1 Known station
2 Free station
3 Know station+
```

```
1
```

Note – An example of free station establishment is found on pagepage 3-31
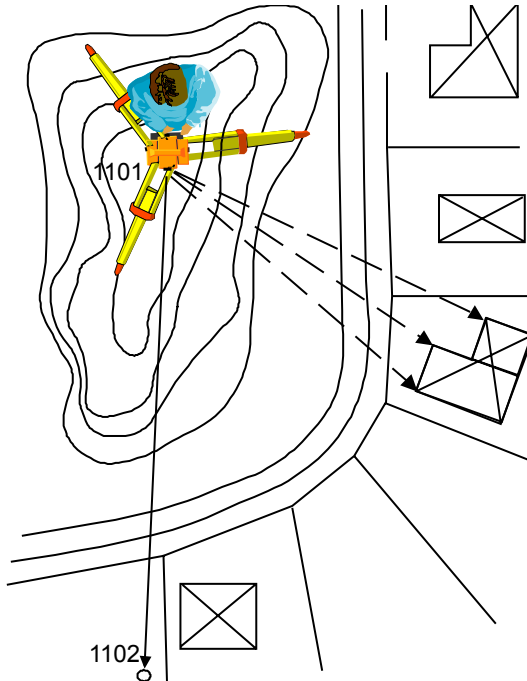

Figure 3.4   Station establishment with a known station and one reference object

Here you key in the number or name of the Job file in which you wish to store data from your station establishment. A

list of data stored in the selected Job file can be seen on page 3-29. Select, for example, Job no = 2.

```
       P20   10:17

Job no=_
```

```

A/M

The instrument displays HA, VA and SD for your first point. Your measurement can now be registered. Press the REG key.

```
STD   P20  10:18*
 HA:xxx.xxxx
 VA:xxx.xxxx
 SD:xxx.xxx
```

REG

Here the difference between measured and theoretical horizontal distance (HD) is shown. Press YES to accept or NO to redo the measurement or select another reference point.

```
Result
Diff HD: - 0.003

Ref ok?
```

YES

Note – Diff HD is shown only if distance has been measured.

Are you going to use more points for your station establishment, or are you satisfied with only one? In our example we will measure and register two more points (maximum number = 10). Press YES.

```
                    10:19

more?

```

YES

Enter the next Pno to be used for your known station (the display here shows the most recently used Pno).

Then press ENT.

```
                    10:19

Pno= xxxx

```

ENT

Note – The points selected for your station establishment can be measured in any order.

Are your coordinates correct? Press YES or NO. If they have to be changed, use Edit or P43 (Enter Coordinates). In this case, we'll answer YES.

```
Ref ok?
N=xxxx.xxx
E=xxxx.xxx
E=xxxx.xxx

```

YES

*Note –   Only displayed if Confirmed is switched on
(MNU 61)*

Enter the signal height (SH). In this case 1 and press ENT.

```
                    10:19

SH=0.000

```

[1]   [ENT]
Note –   Only shown if your coordinates include ELE.

Aim towards your target, then press the A/M key to
measure.
```
STD          10:20*
HA: xxx.xxxx
VA: xxx.xxxx

```

[A/M]

*Note –   If you are using a servo instrument press the
key to position to point 2-10.
Fine adjust manually. See next step.*

The instrument has now measured angles and distance to the second point of your known station establishment. Press REG to register your measured data.

```
STD          10:20*
HA: xxx.xxxx
VA: xxx.xxxx
SD: xx.xxx
```

REG

Diff HD is the difference between measured and theoretical horizontal distance to the second point. Diff HA is the difference between theoretical and measured angle between point 1 and 2. Press YES to accept or NO to redo the measurement.

```
Result
Diff HD: 0.003
Diff HA: 0.0032
Ref ok?
```

YES

Note – If more than 2 points have been measured, Diff HA will be replaced by S_dev HA, i.e the standard deviation of the horizontal angles.

Are you going to use more points for your station establishment, or are you satisfied with two? In our

example we will measure and register one more point (maximum number = 10). Press Yes.

```
STD          10:21

more?
```

YES

Key in the third point to be used, and repeat the procedure described above. In this example, we have measured and stored a total of three points whose coordinates are known for our known station.

Assuming that these have been measured and registered, let us continue directly to the question "more?" after storing the last point.

```
             10:22

Pno=
```
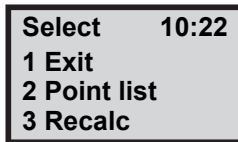

Note – *If you are using a servo instrument press the key to position to point 2-10. Fine adjust manually.*

All points to be used for our known station establishment are now stored. Answer "more?" with NO. The program immediately calculates your station coordinates.

```
STD          10:22

more?
```

NO
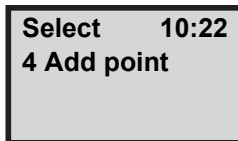

Now you're taken to the Select menu. Here you can choose to either exit P20, edit the point list, recalculate the point data or add more points. (You can switch between the two pages by pressing the ENT button). In this example we choose to edit the point list. Press 2. *See next step.*

```
Select      10:22
1 Exit
2 Point list
3 Recalc
```

ENT
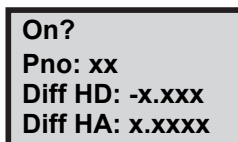

```
Select      10:22
4 Add point
```

2

Here you can choose which points you want to use in the point list. Choose On, Off or Delete by pressing the NO button, then accept with ENT.

```
On?
Pno: xx
Diff HD: -x.xxx
Diff HA: x.xxxx
```

ENT

When you have chosen your points for the point list and accepted with ENT, calculation automatically starts and the result is shown in the display.

Press ENT to exit to the Select menu.

```
Result
List:3      Used:3
S_dev HA:x.xxxx
Press ENT
```

ENT

Now you're taken back to the Select menu. Here you can choose to either exit P20, edit the point list once again, recalculate the point data (i.e se the result once again) or add more points.

(Switch between the pages with ENT).

```
Select        10:23
1 Exit
2 Point list
3 Recalc
```

ENT

Press 4 if you want to add points to improve the result. In this example we're satisfied with the result. Press 1 to exit P20.

```
Select        10:23
4 Add point
```

1

Note –   That the current instrument direction is stored as HA_ref.

  SH = 0.000

```

| 2 | · | 1 | ENT |

Note –   Only shown if height should be determined

The instrument is now in theodolite position and is ready to measure. Aim at the chosen target. Press the A/M key if distance is to be measured, otherwise REG.

```
  STD      10:21*
  HA: xxx.xxx
  VA: xxx.xxx

```

| A/M |

Note –   Distance measurement must be carried out when measuring heights.

The instrument displays HA, VA and SD for your first point. Your measurement can now be registered. Press the REG key.

```
  STD      10:21*
  HA: xxx.xxx
  VA: xxx.xxx
  SD: xxx.xx

```

| REG |

Enter the next Pno to be used for your free station (the display here shows the most recently used Pno). Then press ENT.

```
                              10:21

Pno =xxxx
```

ENT

Note – *The points selected for your station establishment can be measured in any order.*

Are your coordinates correct? Press YES or NO. If they have to be changed, use Edit or P43 (Enter Coordinates). In this case, we'll answer YES.

```
Pno ok?
N = xxxxx.xxx
E = xxxxx.xxx
ELE = xxx.xx
```

YES
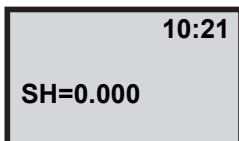

Note – *Only displayed if Confirmed is switched on (MNU 61)*

Enter the signal height (SH). In this case 3 and press ENT.

```
                              10:21

SH=0.000
```

3   **ENT**

Note – *Only shown if your coordinates include ELE*

Aim at your target. Then press the A/M key to measure distance.

```
STD        10:21*
HA: xxx.xxx
VA: xxx.xxx
```

A/M

The instrument has now measured angles and distance to the second point of your free station establishment. Your measured data can now be registered.

```
STD        10:21*
HA: xxx.xxx
VA: xxx.xxx
SD: xx.xx
```

REG

Are you going to use more points for your station establishment, or are you satisfied with only two? In our example we will measure and register two more points (maximum number = 8). Press YES.

```
STD        10:21

more?
```

YES

Note –   If complete measurements have been carried out — that is, angles and distances — two points will suffice. If, on the other hand, only angles have been measured, at least

three points are needed. This is not an optimal solution, and the display warns you with the message "Not Optimized".

Key in the third point to be used, and repeat the procedure described above. In this example, we have measured and stored a total of four points whose coordinates are known for our free station.

Assuming that these have been measured and registered, let us continue directly to the question "more?" after storing the last point.

```
                    10:22

Pno =xxxx

```
Note –   If you are using a servo instrument press the
✴   *key to position to point 3-8. Fine adjust manually*

All points to be used for our free station establishment are now stored. Answer "more?" with NO. The program immediately calculates your station coordinates.

```
STD             10:22

more?

```

NO
These are your new station coordinates plus any standard deviation there may be. To see the standard deviation in N

and E plus the scale factor used, switch the display by pressing the ENT key.

```
STD        10:22
N: xxxxx.xxx
E: xxxxx.xxx
S_dev:    x.xxx
```

ENT

This is the standard deviation in N and E plus the scale factor used (scale factor = 1.0000 if it is off.) Press ENT.

```
STD        10:22
S_devX:xxx.xxx
S_devY:xxx.xxx
SF = 1.00000
```

ENT

Here is your calculated station elevation shown if you have chosen to measure heights.

Here you can also see the standard deviation based on all observations. If the standard deviation or difference in elevation (in the case of 2 points) is too large redo the measurement again without storing the actual.

```
STD        10:22
ELE = xxx.xxx
S_devZ= x.xxx
```

ENT

Note –   On the following pages we will describe how to use the point list. See page page 3-49 if you have deactivated the point list.

Point List

In this example we will take a closer look at the point list which is obtained after you have established your free station (here we assume that the point list has been activated under "Config.").

The point list allows you to look at, and deactivate, any deviations there may be for each point. The deviations are displayed as "dev. =" (radial deviation) and "RT.ofs/Radofs" (right offset and radial offset). We'll select point 1.

```
Free Stat.   10:16
1. Pointlist
2. Recalc.
3. Exit
```

```
1
```

Here you can look at 1 (dev = radial deviation). If there is a major radial deviation, you can make a more detailed analysis by selecting 2 (RT.ofs/Radofs). See Detailed analysis by selecting 2 (RT.ofs/Radofs), page 3-41.

```
Free Stat.   10:16
1. dev.
2. RT.ofs/Radofs
```

```
1
```

Here the radial error is displayed for point no. 1. For an explanation of "dev", see page page 3-52. By pressing ENT you can check the radial errors for all the points.

```
STD          10:16
Pno = 1
Diff = x.xxx
```

ENT

Detailed analysis by selecting 2 (RT.ofs/Radofs)

This is the difference in distance — that is, how much to the left (- value) or right (+ value) your theoretical point lies relative to your measured point (see figure 3.7, page 3-52). Select activation/deactivation and then press ENT.

2

```
Pno = 1
RT.ofs=x.xxx on
on=1        off=0
```

ENT

This is the difference in distance between your measured point and the theoretical point, along the line of measurement. A minus sign indicates that the measured

point lies beyond the theoretical point. A plus sign indicates that it is ahead of that point.

```
Pno =1
Radofs=x.xxx on
on=1        off=0
```

ENT

This page is shown for all points that have 2 coordinates and one measured distance. Any one of these points can be used for calculation of the station height. The displayed value is the difference between the calculated average height and the height, calculated from this point only.

```
Pno =1
dELE = xxx.on
on=1        off=0
```

How to use the point list (cont)

After going through the point list and possibly deactivating one or more parameters of your points, you will have to recalculate using the coordinates you want for your free station establishment. Do this by selecting function 2, Recalc.

```
Free Stat.  10:16
1. Pointlist
2. Recalc.
3. Exit
```

2

These are your new station coordinates together with the resulting standard deviation in N and E. To see the standard deviation in N and E plus the scale factor used, switch the display by pressing the ENT key.

```
STD          10:16
N:  61732.568
E:  21806.327
S_dev:  0.002
```

ENT

This is the standard deviation in N and E plus the scale factor that has been used (scale factor = 1.0000 if it is Off). Press ENT.

```
STD          10:16
S_devX:
S_devY:
SF = 1.00000
```

ENT

Here is your calculated station elevation shown if you have chosen to measure heights.

Here you can also see the standard deviation based on all observations. If the standard deviation or difference in elevation (in the case of 2 points) is too large redo the measurement again without storing the actual.

```
STD          10:16
ELE = xxxx.xxx
S_devZ = x.xxx
```

ENT

Here you select function 3, Exit.

```
Free Stat.  10:16
1. Pointlist
2. Recalc.
3. Exit
```

```
3
```

This is your old station ground elevation.

Press YES (ENT) if you want to replace the old elevation with the new or press No to cancel it. In this example we press YES. (This display will only appear if the station ground elevation has already been determined).

```
STD         10:16
ELE = xxxx.xxx
Replace Z?
```

```
YES
```

Now the instrument is orientated. Do you want to store the point in an Area file answer this question with YES (ENT).

```
STD         10:16

Store?
```

```
YES
```

Key in the name of the Area file in which you want to store the point. Then press ENT.

```
                P0  10:16

Area =
```

ENT

In which memory unit is your Area file to be stored? In our example we are using the internal memory (Imem).

```
Sel device 10:16
1. Imem
2. Xmem
```

* dHA=correction value of the calculated bearing (orientation), which is normally a low figure.			

Here are the data that can be stored in the Job or Area file you have chosen, if you have deactivated the point list in the configuration routine.

Free Station Configuration

In this example, we will describe in greater detail the routine in the free station establishment program called "Config.". This option can only be accessed when starting the program with a long press on the PRG-key, see page page 1-2.

Press 1 to start the program or select 2 to configurate the program. In this example we press 2. Config.

```
         P20    10:15
1 Run
2 Config
```

```
  2
```
Press 1 Exit to return to the previous menu or press 2 options to start the configuration.
In this example we press 2.

```
         P20    10:15
1 Exit
2 Options
```

```
  2
```
Here you are given an opportunity to activate/deactivate a scale factor. The scale factor for free station establishment is calculated and defined based on the internal relation between your known points.
The following applies for the scale factor:
  – Scale factor = 1.0000 if it is not activated (Off).

– If a UTM scale factor (F43) has been given, this value is multiplied by the scale factor calculated for free station establishment.

– The scale factor that has been used is displayed after calculation of your free station (see Free Station3-31).

In this example, we will activate the scale factor.

```
       P20   10:15

Scale factor    on
on=1       off=0
```

1   **ENT**

Here you can activate/deactivate a point list. In the list you will be able to analyse and alter any deviations for each point. The deviations are displayed as "dev" (radial deviation) and "RT.ofs/Radofs" (right offset and radial offset). figure 3.7.

```
       P20   10:15

Pointlist       on
on=1       off=0
```

1   **ENT**

Note –   For a more detailed explanation of how to work with the point list, see page 3-40.
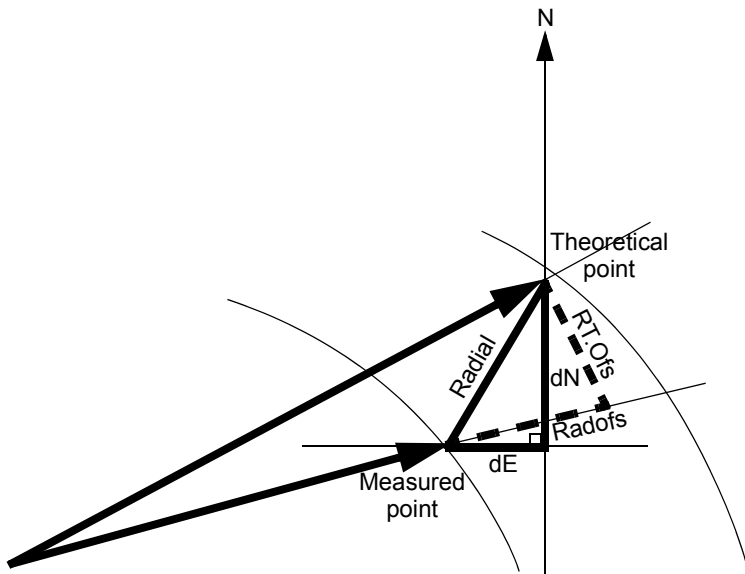

Figure 3.7   Definition of deviations presented in the point list

By using a weight factor you can give priority to your known points with reference to distance. To put it simply, points that are further from your free station have a lower priority than the points that are closer. This function is used mostly in Germany.

Normally no weight factor is used when the network is of good quality. This means that you should choose the weight factor that is defined as s/1.

By pressing the ENT key in steps you can produce three different bases of calculation for the weight factor (see the margin, left). These are intended mainly for Germany, and are not used otherwise. Since we will not be using this function and since weight factor s/1 is the default in position ON, you need press only ENT until the display shows...

```
        P20    10:15
Weight factor
s/1        on
on=1        off=0
```

Note –   Formulas for calculating the weight factor (for the German market).

$100/S$

```
        P20    10:15
Weight factor
100/s      off
on=1      off=0
```

$1000/S^{3/2}$

```
        P20    10:15
Weight factor
1000/s **3 off
on=1      off=0
```

$1000/S^2$

```
        P20    10:15
Weight factor
1000/s **2 off
on=1      off=0
```

Here you can choose to continue with your free station establishment, or repeat your configuration. If you continue with free station establishment, press 1 and then choose 1 Run to start the program.

```
        P20    10:15
1 Exit
2 Options
```

Eccentric Station

Select Program 20.

| PRG | 2 | 0 | ENT |

In this example, we will establish an eccentric station. The known points we will be using have been stored as Pno and coordinates in an Area file using P43 (Enter Coordinates).

Press ENT.

```
Stn estab.  10:19
1.Known Station
2.Free Station
3.Known Station+
```

| ENT |

We will choose function 4, Eccentric Station.

```
Stn estab.  10:19
4.Ecce Station
```

| 4 |

Here you key in the number or name of the Job file in which you wish to store data from your station establishment. A

list of data stored in the selected Job file can be seen on page 3-46 and page 3-49. Select, for example, Job no = 20.

```
              P20    10:19

Job no=

```

| **2** | **0** | **ENT** |

Note – Only displayed if Job/Mem is switched on (MNU61)

Where will you store your Job file? Choose a suitable memory unit by indicating 1, 2 or 3 for activation/deactivation. Then press ENT.

```
              P20    10:19
1. Imem    off
2. Xmem     off
3. Serial     off
```

| **1** | **ENT** |

Note – Only displayed if Job/Mem is switched on (MNU61)

Here you enter a name/number for your eccentric station.

```
              P20    10:20

Stn=

```

| **ENT** |

Are you going to measure heights? Accept this question by pressing YES (ENT). If you decide not to measure heights (press No) it means that the instrument height (IH) and signal height (SH) will be ignored. In this example, we will be measuring heights. Press YES.

```
  P20    10:20

HT Measure?
```

YES

Enter your instrument height (IH). For example 1.75

```
  P20    10:20

IH=0.000
```

1   **·**   **7**   **5**   **ENT**

Note –   Only shown if height should be determined

Key in the name of the Area file in which you have stored your known Pno and coordinates. Then press ENT.

```
  P20    10:20

Area=
```

ENT

In which memory unit is your Area file stored? In our example, we are using the internal memory (Imem).

```
Sel device 10:20
1. Imem
2. Xmem
```

```
1
```

Note – *If you get Info 32 when selecting a memory unit, it may be due to one of the following:*

1. You have chosen the wrong memory unit.

2. The Area file you are looking for is not located in the memory you have selected.

3. The Stn (Pno) which you are looking for is not stored in the Area file you have selected.

    The program will then return to the question "Area =" so that you can enter another Area file number or point number.

Enter the number of the first point you want to aim at. Then press ENT.

```
        P20   10:21
Aim to A
Pno =
```

```
ENT
```

Are your coordinates correct? Press YES (ENT) to accept them. If they have to be changed, use Edit or P43 (Enter

Coordinates). In this example we will continue by accepting them.

```
Pno ok?
N = xxxxx.xxx
E = xxxxx.xxx
ELE = xxx.xx
```

YES

Note – Only displayed if Confirmed is switched on (MNU 61)

Enter the signal height (SH).

For example 2.1 and press ENT.

```
                    10:21

SH = 0.000
```

2 **.** **1** **ENT**

Note – Only shown if height should be determined

The instrument is now in theodolite position and is ready to measure. Aim at the chosen target. Press the A/M key if distance is to be measured, otherwise REG.

```
STD       10:21*
HA: xxx.xxx
VA: xxx.xxx
```

A/M

Note – Distance measurement must be carried out when measuring heights.

The instrument displays HA, VA and SD for your first point. Your measurement can now be registered. Press the REG key.

```
STD      10:21*
HA: xxx.xxx
VA: xxx.xxx
SD: xxx.xx
```

REG

Enter the next Pno to be used for your free station (the display here shows the most recently used Pno). Then press ENT.

```
        P20  10:21
Aim to B
Pno =xxxx
```

ENT

Are your coordinates correct? Press YES or NO. If they have to be changed, use Edit or P43 (Enter Coordinates). In this case, we'll answer YES.

```
Pno ok?
N = xxxxx.xxx
E = xxxxx.xxx
ELE = xxx.xx
```

YES

Note –   Only displayed if Confirmed is switched on (MNU 61)

Aim at your target. Then press the REG to register the data.

```
STD        10:21*
HA: xxx.xxx
VA: xxx.xxx
```

REG

Is your station OK? Press YES if OK.

```
Stn ok?
N = xxxxx.xxx
E = xxxxx.xxx
ELE = xxx.xx
```

YES

Now the instrument is orientated. Do you want to store the point in an Area file answer this question with YES (ENT).

```
STD        10:21

Store?
```

YES

Key in the name of the Area file in which you want to store the point. Then press ENT.

```
                P0  10:21

Area =
```

ENT

In which memory unit is your Area file to be stored? In our example we are using the internal memory (Imem).

```
Sel device 10:21
1. Imem
2. Xmem
```

1

C H A P T E R

4

P21 Z/IZ

In General

Z/IZ is a program for calculating instrument elevation. It will provide several results, such as the ground point elevation or the instrument point elevation. These are obtained by measuring the vertical angle and length of slope to one or more points of known height. This field calculation is also called "instrument point elevation resection", as the mean height and standard deviation are calculated from all the observations.

Z/IZ can be used in a number of applications. For example, it is naturally advantageous to combine Z/IZ and Station Establishment /Free Station when having established your station point in only two dimensions (N and E). By combining these two programs, the three-dimensional coordinates of a point can be calculated and stored in the same Area file and under the same point number in the memory unit you select. In such cases, free station establishment shall be carried out before measuring elevation. Z/IZ also includes P43 (Enter Coordinates).

```
                  ┌─────────────────────┐
                  │    Program 21       │
                  │      Z/IZ           │
                  └─────────────────────┘
                            │
              ┌─────────────┴─────────────┐
  ┌───────────────────────┐   ┌───────────────────────┐
  │     Program 20        │   │     Program 43        │
  │ Station Establishment │   │   Enter Coordinates   │
  └───────────────────────┘   └───────────────────────┘
```
How to use

One application for which Z/IZ is ideal is to determine the
height of a point whose coordinates are known — that is, in
combination with P20 (Free Station function). In the
example below, we have chosen to carry out this kind of
measurement and calculation. It is assumed that you have
already established your station (P20, see page 3-2) and that
the points whose coordinates are known are stored in an
Area file. However, P21 can also be used independently for
height calculation.

The instrument's station has been established. Select
program 21 (Z/IZ).

```
        P0      10:16

Temp = 20.0
```

PRG **2** **1** **ENT**
Key in your station number and press ENT.

```
             P21   10:17

Stn=
```

1 **ENT**
In what memory unit is your Area file stored? In this
example, we are using the internal memory (Imem).

```
Sel device  10:17
1 Imem
2 Xmem
```

1

Key in the number of the Area file in which we have stored
the points whose coordinates are known, which we shall be
using to determine the height of our free station. In this
example, these are located in Area = 2.

```
STD   P21 10:17

Area =
```

2   **ENT**

*Note – If you leave the Area file blank you will be able to
manually key in point elevation later on.*

Here you decide whether you want to measure instrument
point elevation or ground point elevation. If IH is given, the
ground point elevation will be calculated. If no instrument
height is given, the instrument point elevation will be

calculated. In this example, we assign IH = 1.7 m.
Consequently the ground point elevation will be calculated.

```
        P21  10:17

IH =
```

| 1 | · | 7 | ENT |

Note –   This display will not be shown if you have left the Area file blank above.

IH = 1.7m

SH = 1.0m

Ground point elevation
Give the point number for the first reference point stored in the Area file.

```
        P21  10:17

Pno =
```

ENT

Note –   This display will not be shown if you have left the Area file blank above.

The elevation is shown for the reference point selected.

```
STD  P21  10:17

ELE =
```

ENT

*Note – If you left the Area file blank earlier you are able to
manually key in point elevation.*

Here you give the signal height (SH). This must be given
whether the instrument point elevation or ground point
elevation is to be calculated. In this example, SH = 1.0 m.

```
      P21  10:17

SH =
```
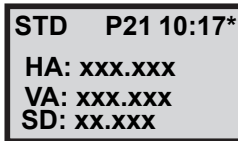

1   **·**   **0**   **ENT**

Now you can begin to measure your first reference point.
Aim and then press the A/M key.

```
STD   P21 10:17
HA: xxx.xxx
VA: xxx.xxx
```

A/M

The display shows HA, VA and SD to Pno 1. Your measurement is now ready to be registered. Press the REG key.
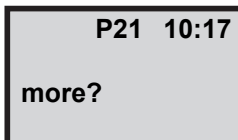

```
STD    P21 10:17*
 HA: xxx.xxx
 VA: xxx.xxx
 SD: xx.xxx
```

REG

Will you use several points for your height calculation or will one point be enough? Note the following: Your result will indicate a mean elevation. This is presented as a difference if two points are included in the measurement. If, on the other hand, you use 3 or more points, a standard deviation (S_dev) is obtained, based on all the observations.

In this example we shall measure two additional points whose heights are known. Therefore answer the question with Yes (ENT).

```
        P21   10:17

more?
```

YES

Give reference point 2, which is to be used for height determination, and repeat the instruction above. In this example we have also measured and stored a third point. We assume now that these measurements are concluded

and we continue directly to the question "more?" after
storing Pno 3.

```
            P21  10:18

Pno =
```

All the points to be used for height determination are now
stored. Answer the question "more?" with No. The program
now immediately calculates any standard deviation.

```
            P21  10:19

more?
```

NO

This is the standard deviation based on all the
observations. If the standard deviation or difference in
elevation (in the case of 2 points) should be too large,
answer the question (Diff ok?) S_dev ok? with No, and
perform the measurements again.

```
            P21  10:19
S_dev = x.xxx
S_dev ok?
```

YES

This is the ground point elevation of your free station. Press ENT.

```
STD  P21  10:19

ELE = xx.xxxx
```

ENT

If the result of your calculation is to be used, the point must be stored in an Area file. Answer the question with Yes (ENT).

```
       P21    10:19

Store?
```

YES

Note – If no instrument height was given (see page 4-3 and the instrument point elevation was calculated, the question "Store?" will not appear. However, the instrument will retain the elevation data until it is switched off.

In this example, we wish to store the elevation coordinates for our station point in the same Area file as the station coordinates for your free station. Select the same Area file in which your free station establishment is stored.

```
       P21    10:20

Area =
```

ENT

If an elevation already exists for the station point you are
given the question "Replace Z?". Press Yes or ENT to store
the new Z or press No to keep the old one.

The program now returns to PO and you can select the next
program.

```
   P21     10:20

Replace Z?
```

YES
Here are the data stored in the Area file you have selected.

```
         Area file
         Pno(Stn)=
            ELE=
```

Note –   Data stored in the selected Area file.

5

P22 Angle Measuring

In General

When using program 22, all you need to do is to locate the targets one time in C1. When all targets are located and stored in your internal or external memory (card memory), you are able to select the measuring mode in which you want to work: Standard or D-bar mode. Now the instrument's servo motors will do the rest. The instrument will rotate and point directly in CII against the first registered target, you will then make the necessary fine adjustments and registrations by pressing the A/M-key in front. For rotation to CI, depress the A/M key for a couple of seconds.

Note – this program can only be used when using the station unit as a total station.

A   B

C2 + C1   C2 + C1

Stn
How to use

The Geodimeter CU is now in program 0 (P0). Choose program 22 - Angle Measurement.

```
STD    P0   13:38
HA:310.8390
VA:98.1720
```

PRG **2** **2** **ENT**

The program name "2 face Ang. Meas." is seen very briefly on the display followed by request of which Job file you want to store your angle measurements in. Key in, for example, 16...

```
STD   P22  13:38

Job no:
```

ENT

Note – Displayed if Job/Mem is switched on (MNU61)

Here you select which memory device you wish to store the Job file in. 1: Imem.

```
STD   P22  13:38
1: Imem off
2: Xmem off
3: Serial off
```

1   **ENT**

Note –   Only displayed if Job/Mem is switched on (MNU61)

Note –   See Geodimeter CU General.

Key in the Stn. point name / number– e.g 1000. Press ENT.

```
STD P22     13:38

Stn =
```

If heights are to be measured the next question would be IH (instrument height). In this example we will press NO, which means that instrument and signal height is not taken into account.

```
STD P22     13:38

HT measure?
```

NO

Key in your instrument height Ih, e.g. 1.75 and press ENT.

```
STD P22     13:38

Ih=1.75
```

1   **.**   **7**   **5**   **ENT**

Here you have the opportunity to choose the numerical value of the Pcode (Pcode is additional software). We will answer NO...

```
STD P22     13:39

Pcode?
```

NO

Key in the number of the first target at which you wish to begin your angle measurement, e.g. 200 ENT...

```
STD P22     13:39

Pno =
```

ENT

Make a coarse aiming towards the first target, then press REG...

```
STD P22     13:39

Aim to point
Press REG
```

REG

In this example we will continue to measure towards more targets. Press YES...

```
                    13:39

more?

```
YES

Key in the second target number – e.g., 201 ENT...

```
STD  P22  13:39

Pno =

```

ENT
Make a coarse aiming towards the second target, then press REG...

```
STD P22    13:39

Aim to point
Press REG
```
REG

Repeat the instructions above for your following targets. When all your targets are stored you will answer no to this question. Press NO...

```
                13:39

more?

```
NO

The program gives you the opportunity to select in which measuring mode you want to work. In this example we will select No. 2= D-bar mode...
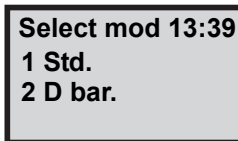

```
Select mod 13:39
1 Std.
2 D bar.

```

2

Select normal or high resolution, in this case we will select normal.

```
 P32        10:17
1 Normal
2 High res.

```

1
Note – *This display will only appear if you have a Trimble 5601.*

Key in your signal height SH, e.g. 1.75 and press ENT.

```
STD P22      13:38

SH=1.75
```

1   **.**   **7**   **5**   **ENT**
The instrument starts to rotate to C2 position, aiming at target No. 200.

The number of sightings is entirely up to you, the operator, and will depend mainly on the visibility conditions and the type and required accuracy of the survey work. In this example we have chosen to make two sightings in C2.

Approach the target from the other direction using the motion screws and press A/M...

Press ● in front and Press ● in front a second time.

After pressing A/M the second time, the mean of angular C2 values is stored in the memory of the instrument. The rule when measuring angles in this mode is that the same number of sightings must be made in both C2 and C1. Rotate the instrument to C1 position by depressing the A/M key in front for approx. 2 sec.

Press ● in front

Approach the target from the other direction using the motion screws. Press A/M.

```
┌─────────────────────────┐
│ D      P0     13:40     │
│ HA:        123.9965     │
│ VA:        102.2230     │
│ II: 2           I: 1    │
└─────────────────────────┘
```

A/M

The second C1 angle measurement and indication of completion (i.e., II:2) is very quickly shown on the display.

However, the values now seen on the display are the final mean horizontal and vertical angle values of the mean of the angles measured in both faces.

The dH & dV values displayed are the amounts by which the angles have been adjusted – i.e., half the sum of the remaining horizontal and vertical collimation and pointing errors.

Now it is time to measure the distance. Press A/M or REG if length is not to be measured.

```
┌─────────────────────────┐
│ D      P0     13:40     │
│ HA:        123.9965     │

E:         2148.851
ELE:        397.851
```

REG

Note –   After the last point your are prompted "Repeat ?" If answering Yes to this question, all points are remeasured.

The following data is stored in the chosen Job file after pressing the REG key.

Job file	
Stn	
IH	If measuring heights
Pno	
Pcode	If Pcode is entered
HA	
VA	
SD	If distance measurement has be done
HAII	0 if no measurement in face 2
VAII	0 if no measurement in face 2
HAI	0 if no measurement in face 2 D-mode
VAI	0 if no measurement in face 2 D-mode
.	
.	

P23 SetOut

In General

SetOut will allow you to set out points in the field much quicker and will also give you access to an automatic point check and storage routine.

SetOut Point Data

Storage of coordinates and heights of known points is carried out with Program 43 - ENTER COORD. Use of Program 43 means manual keying in of the points. Point storage can be carried out either in card memory or Internal Memory. During the running of programs 20/23, the stored coordinates are recalled from the specified memory device and are used for both orientation of the instrument station and calculation of the bearing and horizontal distance to the set out points.

Automatic Check of Set Out Point´s Position

After having set out the point, you can check its position accuracy relative to the stored point coordinates and height. These deviations are displayed in form of radial and right angle offsets plus height difference. The ± signs of these deviations corresponds to left and right in relation to the point´s correct theoretical position. Once the point has been set out i.e. when the offset values are zero or almost zero, P23 allows the deviations dN, dE and dELE to be stored in card memory or Internal Memory. As a final check, the point´s present actual coordinates i.e. N, E and ELE can be viewed and compared with the correct theoretical point coordinates and elevation. If you would also like to store these N, E and ELE values, we recommend that you configure the user defined output table (see page 1-4).

How to use

The instrument's station has been established. Select program 23 (SetOut).

```
   P0      14:32

 Temp = 20.0
```

PRG **2** **3** **ENT**

Key in the number of the Jobfile in which you want to store the set out point data. Then press ENT.

```
     P23  10:17

 Job No=_
```

ENT

Note – Displayed if Job/Mem is switched on (MNU61)

Activate the device you wish for storage of the Job file by choosing the appropriate number 1, 2 or 3.

```
     P23  10:17
 1: Imem off
 2: Xmem on
 3: Serial off
```

1 **ENT**

Note – Only displayed if Job/Mem is switched on (MNU61)

This was the Station No. you entered in program 20, Station Establishment. Press ENT.

If no station establishment has been made, P23 will automatically propose establishment of a known or free station (P20) when you press ENT. See page 3-2.

```
        P23  10:17

Stn=1000
```

ENT

Note –   Only displayed if Stn is switched on (MNU61)

Key in the Area file number in which the set out point coordinates are stored and press ENT.

```
        P23  10:17

Area =_
```

ENT

Choose what type of device in which the points are stored. If heights are to be set out, next question would be SH=.

```
        P23  10:17
1 Imem
2 Xmem
```

1

Note –   Signal Height

If you have entered a Pcode for the set out point you can enter the desired Pcode here. The program will then seek for the point with that Pcode. If you have no Pcode just leave the line blank and press ENT.

```
         P23  10:17

Pcode =_
```

ENT

The program suggests the first point in the Areafile. Accept it or key in the point number at which you wish to begin with your setting out task. In this example we key in 206.

```
         P23  10:17

Pno =1
```

2 **0** **6** **ENT**

Note –   If you have more than one point in the Areafile to set out the program will automatically suggest the next point.

Check the coordinates and answer YES to accept them or NO.

```
Pno ok?
N= 975.000
E=1025
ELE=4.098
```

YES

The instrument now automatically switches to the TRK-mode.

The instrument should be rotated to the right + 70.000 degrees.

```
TRK  P23  10:17

HA:    50.000
dHA: 70.000
```
 - = Left

+ = Right

Note – If you have servo you can rotate the instrument by pressing the key ◄►

Here follows the count down to zero angle method. See page 6-9 for the radial/right angle method.
Countdown to Zero Method

When the instrument displays dHA approx. 0.0000 it is pointing in the direction of the point to set out.

HA is the calculated bearing to the set out point.

```
TRK  P23 10:17

HA:  120.0000
dHA:  0.0000
```

As soon as the prism comes within the measurement beam you will see dHD=remaining. In this case the prism is on line but the distance has to be increased by 2.75m.

```
TRK  P23 10:17
dHA:  0.0000
dHD:  2.75
dHT:  0.155
```

Note – Measurement tip!
It is convenient to decrease the number of decimals in the Label 77=dHA. This can be done via menu 13.

The point is now set out. Press ENT to check the points coordinates and deviations to the theoretical set out point. Switch to STD or D-bar mode to check the point more accurately.

```
TRK  P23 10:17
dHA:  0.0000
dHD:  0.00
dHT:  0.000
```

Note – Rotate the instrument with servo!

If you press ▓ without measured distance ELE=the height at the theoretical set out point.

If you press ▓ with measured distance ELE=the height at the measured set out point.

If you press ▓ longer than 1 sec. with measured

distance ELE=the height at the theoretical set out point.

+dELE ↑ -dHT
- - - - + - - ● Set out point
-dELE ↓ +dHT

When the radial offset, right angle offset and dHT are 0.00, the correct lateral set out position and height have been set out.

```
TRK  P23  10:18
Radofs:  0.00
RT.  ofs:  0.00
dHT: 0.000
```

ENT

Note – Skip point!
If you have difficulties to set out the point, the program will give you a opportunity to skip it. Turn the instrument away from the prism when HA and dHA are displayed and press Reg. The question "Skip Point?" will be displayed. Answer YES to this question and the program will continue with the next setting out point.

When you press REG, these are the three values which are stored in the memory, i.e. deviations from the correct set out point coordinates. Press REG to record deviations or

ENT to see coord. of the set out point. In this example we press ENT.

```
TRK  P23 10:18
dN: 0.00
dE: 0.00
dELE: 0.000
```

ENT

These are the actual coordinates of the set out point´s present position. Press REG to store the deviations.

```
TRK  P23 10:18
N: 975.000
E: 1025
ELE: 4.098
```

REG

Note – Only displayed if Confirmed is switched on (MNU 61)

The program continues with the next set out point. Press the PRG-key and 0 to exit to theodolite mode.

Radial/Right Angle Offset Method

Aim the instrument towards the prism bearer.

```
TRK  P23 10:18

HA:     50.000
dHA:  100.000
```

When the prism comes within the measurement beam you will see dHD=remaining. Press ENT to see the values for radial and right angle offsets.

```
TRK  P23 10:18
dHA: 100.000
dHD: 2.75
dHT:  0.155
```

ENT

In this case the prism should be moved 3 meters towards the instrument and 2 meters to the left. The instrument should also be tilted up 0.155 meters.

```
TRK  P23 10:18
Radofs:   2.00
RT:ofs:  -3.00
dHT:      0.155
```

When the radial offset, right angle offset and dHT are 0.00, the correct lateral set out position and height have been set out.

```
TRK  P23 10:18
Radofs:  0.00
RT.ofs:   0.00
dHT: 0.000
```

Set out point

Instrument point

When you press REG, these are the three values which are stored in the Imem, i.e. deviations from the correct set out point coordinates. Press REG to record deviations or ENT to see coord. of the set out point. In this example we press ENT.

```
TRK  P23  10:18
dN: 0.00
dE: 0.00
dELE: 0.000
```

ENT

These are the actual coordinates of the set out point´s present position. Press REG to store the deviations.

```
TRK  P23  10:18
N: 975.00
E: 1025.00
ELE: 4.098
```

REG

The program continues with the next set out point. Press the PRG-key and 0 to exit to theodolite mode.

Note – Skip point!
If you have difficulties to set out the point, the program will give you a opportunity to skip it. Turn the instrument away from the prism when HA and dHA are displayed and press Reg. The question "Skip Point?" will be displayed. Answer YES to this question and the program will continue with the next setting out point.

P24 RefLine

In General

RefLine is a program with many applications in the field. The idea is to measure markings along, or parallel to, a predetermined line. If, for example, you have two points whose coordinates are known, you can use this program to place any number of points along the line or, at a specified distance, parallel to it.

It does not matter whether you have visibility between the points or not. Nor does it matter if you go beyond the line's end points. The program will maintain the direction of the line independent of distance. The program can be used for a variety of applications in the field — for example, setting out for pipelines or electric power lines, constructing facade walls on profiles, for drainage ditches, along roadways, etc.

RefLine (P24) also contains P20 (Station Establishment) and P43 (Enter Coordinates).
Figure 7.8   Programs included in Refline

The program is divided into two different parts:

• Known or Unknown line

You can enter the coordinates for the reference line if they are known or construct a reference line by measuring two points. In the first case it is necessary to have established the station before using the program otherwise the program will automatically propose station establishment, P20. In the second case you don't

establish the station since the program will create a new coordinate system with origo in the first point in the reference line.

- Measure or SetOut

  In the second part you can choose between measure and set out points from the reference line.
Figure 7.9

Configure

To get to Configure, make a long press on PRG key, select Refline and press ENT.

PRG

Press 2 to Configure.

```
        P24     10:15

P25 Area Calculation

In General

With program 25 you are able to calculate the area and the volume between measured point. The program contains three main functions:

1. Calc

With this function you can calculate the area between measured points in the order they are registered.
2. Arrange List

With this function you can arrange a list of measured points and calculate the area between the points in the order they are arranged in the list.
3. Volume

With this function you can enter a height for the area and calculate the volume.
How to use

The Geodimeter is now in program 0 (P0). Choose program 25 – Area Calc.

```
STD  P0  13:38
HA: 310.8390
VA: 98.1720
```

PRG   **2**   **5**

Here can choose if you want to calculate the area in the order the points are measured (1 Calc) or if you want to arrange the points in a different order and calculate that area. Here we choose 1 Calc.

```
         P25   13:38

1 Calc
2 Arrange list
```

1

Key in the Job file in which the measured points are stored and press ENT.

STD  P0    13:39

HA: 45.0009
VA: 120.0984
```

9

P26 DistOb

In General

DistOb will allow you to calculate distances between objects even if the line of sight is obstructed. The program calculates the horizontal distance and the difference in height between two points. If the instrument is oriented in a coordinate system the true bearing (azimuth) between the two points will be calculated as well.

How do I work with DistOb

This is done simply by choosing the program 26. Select a Stn.point where you have a free line of sight to the two points between which you would like to measure the distance.
The result is given in the form of HA=bearing, HD=horizontal distance and DHT=difference in height between these two points.

The actual measuring can be made using two different combinations:

Combination 1

HA, HD and DHT are displayed as the measured and
calculated result between point 1 to 2, 2 to 3 and so on.
Combination 2

HA; HD and DHT are displayed as the measured and
calculated result between point 1 to 2, 1 to 3 and so on.
How to use

Switch on the instrument and go trough the Start procedure until the instrument is in theodolite mode.

The instrument´s station has been established. Select program 26 (DistOb).

```
STD    P0  10:16

P28 Obstructed Point

In General

Obstructed Point is a program which will help you to measure towards obstructed points.

The method simplifies the measuring task since the range pole does not have to be held in a levelled position. Mount two prisms on a range pole. Locate the pole on the difficult point and measure towards each prism. The program will then calculate the position of the difficult point.To get the best result locate the prism B a close as possible to the obstructed point, C. The highest accuracy of the measurement is also achieved if the distance between prism A and B, dist AB, is as large a possible. See figure 11.13.
Figure 11.13   Distance definitions.

How to use

Mount two prisms on a range pole and note the distance BC, see figure 11.13 on page 11-2 The distance between the two prisms will be calculated and does not have to be entered. Locate the pole on the obstructed point (it is not necessary to hold the pole in a levelled position).

Select program 28 (Obstructed Point).

PRG **2** **8** **ENT**

Key in the number or name of the Job file in which you which to store data about your measurements. A list of data stored in the selected Job File can be seen on page page 11-9.

P29 RoadLine

In General

RoaldLine is a program for setting out road/rail lines. It is easy to use and contains routines for registering section interval, centre offsets, section (="chainage" in some countries or "station" in USA), coordinates and different types of road/rail elements. The program also contains check/control function which ensures that the stored element parameters are correct. Two methods can be used while setting out; 1. Conventional radial setting out and 2. Orthogonal or rectangular setting out. At key in of section interval (longitudal section) and iptional centreline offset (-=Left, + =Right), the program automatically converts the setting out point coordinate values to setting out data i.e. Horizontal distance and Bearing.

The program covers intergrated use of following programs:

```
          ┌─────────────────┐
          │    RoadLine     │
          │      P29        │
          └─────────────────┘
        ┌──────────┴──────────┐
┌───────────────────┐ ┌───────────────────────┐
│ Enter Coordinates │ │ Station Establishment │
│       P43         │ │         P20           │
└───────────────────┘ └───────────────────────┘
```
Structure

Roadline comprises 4 main functions:

Store

For registration of the start and end coordinates of the different elements.

Check

For mathematical check of the stored element coordinates and parameters.

Set Out

For setting out points along roadline both centreline and offset, plus station establishment (Known or Free Station).

Measure

For measuring in existing roadline elements, both centreline and offset, and objects that may lie along the roadline.

Store

With this function in the RoadLine program you store all roadline data, i.e. section interval, centre line offset, section. Start and end coordinates of the different roadline elements and type of element. A roadline can contain 3 types of elements:

- **Straight**
- **Circular Arc**
- **Transition**

Roadline data is stored in the form of section, start and end points of the element and the type of element, i.e. straight, arc or transition. This data is then either stored in the internal memory of the instrument or in Geodat.

When storing circular arc and transition elements, radius and A-parameter must also be stored. While storing transition curves instead of keying in the A-parameter, the option to store Radius and length is open (A= $\overline{R \times l}$). In this case, at the prompt "Radius", key in the RxL factor, at the prompt "Length" key in – 1 or 1 which is the direction of the curve (-=Left, no sign=Right).

When storing roadline data, you must ensure that the following combinations **do not occur** in the data produced by your road design program:

- **Transition- Transition-Transition**
- **Straight-Transition-Transition**
- **Transition-Transition-Straight**
- **Straight-Transition-Straight**

In order to overcome the problems concerning the mathematical solutions of any of the above combinations, they can be overcome by defining a radius at the different elements connecting points, i.e. by defining a straight or arc element and placing it between the elements in question. These "pseudo elements" need only have a longitudal length of a few millimetres, which will not effect the accuracy of the eventual setting out of the points which lie along those elements. In the case of the first combination, store it with this combination instead:

- **Transition-Straight-Transition-Straight-Transition**

Check

This function mathematically checks the stored coordinates and curve parameters of the different elements after registration of the data in an Area file. All errors in excess of 20 mm are displayed and the element in which they are. Errors which occur due to wrongly keyed in In-Data can be easily rectified with the help of Edit (MNU2).

Note – A detected error can depend on either key in errors or incorrect design of the roadline.

Set Out

Before any setting out task can be commenced, it is necessary of course to inform the Geodimeter CU of the position at which the instrument is set up. Program 29 contains Station establishment.

Setting out task

After establishment and orientation of your survey station, registration of section interval and centre line offset is carried out (if it has not already been done with the STORE, option file). Directly thereafter the setting out data in the form of horizontal bearing and horizontal distance to the setting out point are calculated. If cross section data is available for each or some sections, 3 dimensional setting out of cross sections can be executed. In this case questions regarding (HT-measure?) in the station establishment program must be answered with YES.

Measure

The option Measure enables the operator to localize the section and centre line relative to a stored roadline. You simply measure an arbitrary point and the program calculates the section/centre line offset and coordinates of the point. This part of the program is especially suitable for cross-sectioning or localizing an obstacle when checking a planned section of road.

How to use

Before beginning to use RoadLine in the field we recommend that you run trough the program in the office. Switch on the instrument, and disengage the dual-axis compensator with function 22 and step through program 0 by pressing only ENT until you place instrument in the theodolite mode.

P29 - 1. Store

The instrument´s station has been established. Select program 29 (RoadLine).
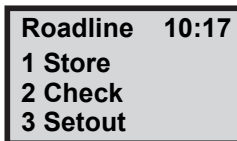

```
STD    P0  10:16

HA=392.9095
VA=102.8955
```

PRG **2** **9** **ENT**

Now you can choose between the four main functions. Let us start to store roadline data. Press 1.

```
Roadline    10:17
1 Store
2 Check
3 Setout
```

1

At this stage you are able to select if you want to store the Section incrementation and Offset, but this can also be done in Setout. Let us select Roadline. Press 1.

```
Store        10:17
1 Roadline
2 Sect/Offset
```

```
1
```

Note – In this case the offset and incrementation values will not be saved when you exit the program.

This is a display of the memory devices available. Let us select in which device we shall store our roadline data e.g. Imem (Internal Memory). Press 1.

```
Sel.device  10:17
1 Imem
2 Xmem
```

```
1
```

Key in the name of the Area file in which you wish to store the Section No., Coordinates and type of elements and press ENT.

```
         P29     10:17

Area=_
```

```
ENT
```

This is a switch key, you can choose if you want to store A-param or if you want to store Radius and Length. In this case we choose 1.

```
Clothoid    10:17

1 A-param
2 Radius/Length
```

```
 1 
```

Key in the first Section No. for the roadline. In this example we key in 399.990 and ENT.

```
     P29    10:17

Sect.=0.000_
```

```
ENT
```

Key in the Northing value of section No. 399.990. In this example it is 13751.63.

```
     P29    10:17

Sect.=399.990
N=
```

```
ENT
```

Key in the Easting value of section No. 399.990. In this
example it is 20872.790.

```
        P29     10:17

Sect.=399.990
E=
```

ENT

Select type of roadline element, Straight, Arc or Roadline
end by pressing NO until the correct element type is
displayed. Accept the type by answering YES. In this
example we choose ARC.

```
        P29     10:17

Sect.=399.990
Arc?
```

YES

Key in the radial dimension, in our example-1400. After you
have pressed ENT, a beep signal will be heard. The
roadline data for section 399.990 are now stored in Area file
100.

```
        P29     10:19

Sect.=399.990
Radius=
```

ENT

Key in the next section point and repeat the above instructions. In this example we key in 770.023 and ENT.

```
   P29     10:19

Sect=0.000_
```

ENT

When you are selecting the last roadline element, select Roadline end. Roadline end=YES, means that the last element will be stored as a straight line.

```
   P29     10:19

Sect.=3297.592
Roadline end?
```

YES

Note – The last element must be a straight line.

You are now returned to the program P0.

```
STD  P0   10:19

HA: 266.9930
VA: 110.1425
```

You have now stored all roadline data in Area file 100, the stored data are; the different types of roadline elements, section no. and coordinates. Now it´s time to check the keying in and geometrical solutions of the different roadline elements with the help of function CHECK.

P29 - 2. Check

Choose program 29.

```
STD  P0   10:19

HA= 392.9095
VA= 102.8955
```

PRG **2** **9** **ENT**

Let us select the control function CHECK. Press 2.

```
Roadline   10:19
1 Store
2 Check
3 Setout
```

2

Select in which device roadline data is stored. In this example it is in the internal memory.

```
Sel.device 10:19

1 Imem
2 Xmem
```

1

Key in the name of the Area file you wish to check.

```
        P29    10:19

Area=_
```

ENT

The program check each element stored in Area file.

```
        P29    10:19

Elem:1
Diff:
```

ENT

*Note –   A comparison with the total longitudinal centre
line measurement of each individual section is carried out.
If the final result gives an error message, one or more
elements contain errors in which curve length errors are
20mm. Re-check the roadline and define the element with
an error. The element can be changed with EDIT (MNU 2).*

After have gone through CHECK the instrument returns to
program P0.

```
STD  P0   10:16

Temp=20.0
```

P29 - 3. Set Out

Choose program 29.

```
STD  P0    10:17

HA= 392.9095
VA= 102.8955
```

PRG **2** **9** **ENT**

Let us select start the setting out. Press 3.

```
Roadline  10:17
1 Store
2 Check
3 Setout
```

3

Key in the number of the Job file in which you want to store the set out point coordinate deviations.

```
STD  P0    10:17

Job no=0_
```

1 **6** **ENT**

Note – Displayed if Job/Mem is switched on (MNU61)

Storage of Control Data

The coordinate deviations will represent the differences between stored set out point coordinates and the actual set out point coordinates. This is the basis of the printed out

data sheet which will act as proof of having carried out your setting out task to within the contract specified accuracy.

These dN, dE and dELE deviations are also much easier to use than comparing actual set out values with their respective theoretical values. If you don't want to store any control data, clear the suggested Job no, and press ENT. Control data that will be stored are:

```
Pno=Section/Offset
dN=
dE=
dELE=
```

If height measurement is carried out also elevation is stored (staked Elevation). If you wish to store other control data you can Configure the user defined output table.

Here you can activate which device you wish for storage of the Job file by choosing the appropriate number. Here we choose the internal memory. Press 1 and ENT.

```
     P29    10:17
1 Imem off
2 Xmem off
3 Serial off
```

[1]   [ENT]

Note –   Only displayed if Job/Mem is switched on (MNU61)

Is "1" your station? As station establishment was done prior to P29, this station will be proposed now. If no station establishment has been made, P29 will automatically propose establishment of a known or free station (that is, P20 Station Establishment) when you press ENT. In this

example we will continue by accepting the suggested
station. Press ENT.

```
       P29    10:17

Stn=1
```

ENT

Choose the type of device in which the roadline data is
stored. In this example we have stored the roadline data in
Imem Area 100. Press 1.

```
Sel.device 10:17

1 Imem
2 Xmem
```

1

Key in the Area file number in which the roadline data I
stored and press ENT.

```
       P29    10:17

Area=_
```

ENT

Here you are able to select which Sec.Inc. you shall have in
this roadline example. If you already have stored Sec. Inc.

in "Store", the program selects that value. Let us select Sec.Inc.=10m. Press 10 and ENT.

```
   P29     10:17

Sec.Inc=10.000
```

```
 1      0    ENT
```

Now you are able to store the centre line offset.
" 0 " =centreline.

```
   P29     10:17

cl.ofs=
```

```
 0      ENT
```

Answer YES to this question if you have more values to store, in our example- 5m, -10m to the left and 5m, 10m to the right. When all offset values are stored answer NO to the question.

```
   P29     10:17

more?
```

```
 NO
```

The program checks that the element combinations, shown on page 12-3 do not occur. Wait!

```
STD P0      14:32

Roadline check
Wait!
```

The program suggests the first section in the Area file, but can easily be changed to any value. In this example we accept the value, press ENT.

```
          P29  10:17

Sect.=399.990
```

ENT

The program is presenting the centreline for the first section, if ok press ENT, otherwise you will have the opportunity to select another offset value. Press ENT.

```
          P29  10:17

cl.ofs=0.00
```

ENT

Is the setting out data for the first section ok. Press YES.
The instrument adopts the TRACKING mode automatically

```
         P29  10:17
Sect.:399.990
cl.ofs:0.00
ok?
```

YES

The countdown zero method

The instrument should be rotated to the right + 170.3595
degrees. - =Left, + = Right. This is called the count down to
zero angle method. See page 12-21 for the radial/right
angle method.

```
TRK  P29   10:17
HA:129.8210
dHA:170.3595
```

When the instrument displays approx. 0.0000 opposite
dHA, it is pointing in the direction of the first section point.
HA is the calculated bearing to the first section point.

```
TRK  P29   10:17
HA:300.2475
dHA:0.0000
```

As soon as the prism comes within the measurement beam you will see dHD=remaining. In this case the prism is on line but the distance has to be increased by 2.75m.

```
TRK P29   10:17
dHA:0.0000
dHD:2.75
dHT:-0.155
```

When the radial offset, right angle offset and dHT are 0.00, the correct lateral set out position and height have been set out.

```
TRK P29   10:17
Radofs:0.00
Rt.ofs:0.00
dHT:0.000
```

```
ENT
```

Measurement tip

When using the count down to zero as your setting out method, it is convenient to decrease the number of decimals in the Label 77=dHA. This can be done via menu 13.

Note –   If you during the setting out will have difficulties in being able to set out the point, the program will give you a opportunity to skip it. Just press Reg and the question "Skip Point?" will be displayed. Answer YES to this question and the program will continue with the next setting out point.

When you press REG, these are the three values which are stored in the Imem, i.e. deviations from the correct set out point coordinates. Press REG to record deviations or ENT

to see coord. of the set out point. In this example we press ENT.

```
TRK  P29   10:18
dN:0.00
dE:0.00
dELE:0.000
```

ENT

Note – Rotate the instrument with servo!

If you press ◼◤◥ without measured distance ELE=the height at the theoretical set out point.

If you press ◼◤◥ with measured distance ELE=the height at the measured set out point.

If you press ◼◤◥ longer than 1 sec. with measured distance ELE=the height at the theoretical set out point.

+dELE ▲ -dHT

How to combine countdown to zero and radial/right angle offset for setting out

In order to benefit most from the inherent intelligence of your Geodimeter CU, we recommend that you try to combine the two different setting out methods, previously described. Here below is an example of how we combine the countdown to zero method with the radial and right angle offset method.

1. If the setting out data for the first section is ok, press YES and the instrument will automatically adopt the TRACKING mode. The display will show the calculated bearing, Hz, and the dHA.

2. Rotate the instrument until the display shows approx. DHA=0.0000.

3. The instrument is now pointing in the direction of the first setting out point.

4. Guide the prism bearer on line with help of the tracklight[®].

5. As soon as the prism comes within the measurement beam, you will see dHD=remaining distance to your set out point.

6. By pressing ENT at this stage, you are also able to see the radial and right angle offset to the point. When

Radofs.=0.0000 and RT.ofs.=0.0000, the correct lateral set out position is reached.

Ref.point
Height Setting Out

If cross section data is available for each or some sections, 3 dimensional setting out of cross sections can be executed. The following must be true:

1. It is assumed that elevation exists in your Stn. Coordinates.

2. The question height measurement "HT=?" comes up in the program 20 Station Establishment.

3. If YES, "IH=?" (Instrument Height) appears automatically.

4. The question "SH=?" (Signal Height) appears when you enter the setting out part of the program. If you are going to use R.O.E (Remote Object Elevation) we recommend that you key in SH=0.

5. After given section interval and centreline offset the question "SHT" appears. Key in the information given in your cross section.

Measurement tip

If you would like to set out the height e.g. at +1.0m, add 1.0m to your instrument height and use R.O.E. When dHT=0 you are pointing 1.0m above finished construction level.

P29 - 4. Measure

Choose program 29.

P30 Measure Coordinates

In General

With Program 30, Measure Coordinates, you can measure
and store your coordinates directly to an Area file, i.e you
don't have to store the coordinates in a Job file and then
transfer them to an Area file. The coordinates can then be
used for new station establishments.

Program 30 is included in the following programs:

**Program 30
Measure Coordinates**

- **Program 23 SetOut**
- **Program 24 RefLine**
- **Program 29 RoadLine**
- **Program 39 RoadLine 3D**
- **Program 40 U.D.S**
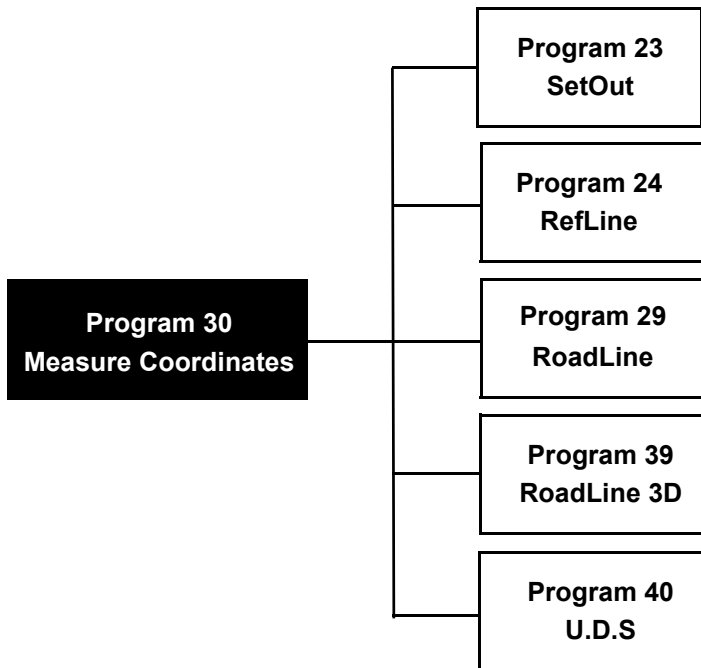

How to use

Assuming that Station Establishment has been carried out at your station point press PRG 30 and ENT to start program 30.

| PRG | 3 | 0 | ENT |

The text "Measure Coord" will briefly show on the display and then your Stn number is shown. Press ENT.

P30	10:16

P32 Angle Measurement Plus

In General

With Angle Meas Plus you can measure multiple rounds of angles, with automatic calculation of "station mean values". The measured angles will be reduced to a final result where you can get a standard deviation for the sightings. You can also configure your own limits for horizontal and vertical angle errors.

It is possible to choose between manual or automatic aiming towards the targets to measure. In the latter case you'll need a Remote Target (RMT) at every point to measuring.

In automatic mode you can choose to get the slope distance also in C2.

Configuration

To speed up the program you can configure it so it fits your needs. The configuration part can be accessed by a long press on the PRG-key. Then choose program 32, Angle Meas Plus and press ENT. Choose option 2, Config and then 2 Options.

If you get a deviation larger than this value the program will show an error message. This error limit is only to make sure that you measure towards the correct target.

```
P32          10:17

Error limits HA
Point=0.0200
```

ENT

One set= one measurement towards one point i both faces. If you get a difference between two sets that is larger than this value the program will show an error message.

```
P32              10:17
Error limits VA
Point=0.0200
Set=0.0050
```

ENT

This tells how much the instrument will point aside the point to measure, in order to force the user to do the fine adjustment when using a servo driven instrument.

```
P32              10:17
Aim offset
Offset=0.0500
```

Finally choose Exit and then Exit again to quit or Run to start the program.

How to use

Select program 32 and press ENT.

`PRG` `3` `2` `ENT`

First you will step through a number of switches that you can configure. If you wish to change a switch, press the corresponding number and ENT, otherwise press only ENT.

```
Switches   10:17
1 Elevation? Yes
2 Pcode? Yes
3 Sightings>1 No
```

`ENT`
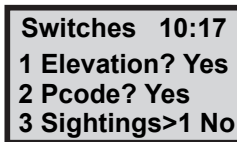

1. To get questions about IH and SH.

2. Set a point code for each point.

3. Enable this if you wish to do more than one adjustment towards each point in a set.

4. Store Horizontal and Vertical distances instead of SD. (Not possible if you want to measure a distance in CII, Automatic mode.)

5. Enable this if you want the instrument to automatically switch to face 1 between each set. If you wish to run automatic mode this must be enabled.

```
Switches   10:17
4 Reg HD/VD No
5 Set-transit? Yes
6 Aim offset Yes
```

`ENT`
6. Enable this if you want the instrument to point beside each point so that you can do the fine adjustment yourself (only servo).

7. Enable this if you want a new horizontal angle for every set according to the formula 200 grads (180°)/no of series.

```
 Switches   10:17
7 Adjust HA? Yes
8 Maxmin? No
```

ENT

8. Enable this if you want to get the difference between the highest and lowest measured value. In other case you will get the standard deviation.

Enter the number of points (2-10) in the set and press ENT.

```
 P32          10:17

No. of points=2
```

ENT

Key in the number of repeated measurements you wish to perform and press ENT.

```
 P32          10:17

No. of series=2
```

ENT

Choose 1 Automatic and you'll only have to aim once at the target, then the program will automatically switch face and perform the number of remeasurements you set.

In this case we will choose 2 Manual.

```
 P32        10:17
1 Automatic
2 Manual
```
```
  2
```

See page 14-19 for 1 Automatic

Choose which mode you wish to measure in, STD or D-bar.

```
 P32        10:17
1 STD
2 D_bar
```

```
  2
```

Select normal or high resolution, in this case we will select normal.

```
 P32        10:17
1 Normal
2 High res.
```

```
  1
```

Note – *This display will only appear if you have a Trimble 5601.*

Enter the station number and press ENT.

```
 Stn        10:17
Stn=1000
```

ENT

Enter a point code for the station and press ENT.

```
 Stn        10:17
Stn=1000
Pcode=1
```

1   **ENT**

Enter an instrument height and press enter.

```
 Stn        10:17
Stn=1000
Pcode=1
IH=x.xxx
```

ENT

Key in a name for the first point and press ENT.

```
 Point 1    10:17
Point=2000
```

ENT

Do you wish to increment the point number for each new point, press YES or ENT, otherwise press NO.

```
Point 1      10:17
Point=2000
Incr?
```

ENT

Here you have the opportunity to choose a Pcode for the first point. If you don't wish to have any Pcode leave the line blank and press ENT.

```

```

ENT

Do the fine adjustment towards the point and press A/M to measure or REG to store without measuring.

In the second case you will be prompted the following:

No meas. made

REG OK?

Press YES or ENT to accept or NO to cancel.

```
D  0        10:17*
HA: 6.8596
VA: 101.1072
```

A/M

This is the first sighting towards point 2001 in face 1. Press REG to store the measurement.

```
D 0          10:17*
HA: 6.8596
VA: 101.1072
SD: 372.290
```

REG

If you have enabled switch no 3 this display will appear. Press YES or ENT to make another sighting or NO to cancel.

Switch to face 2 (automatic if you have a servo instrument).

```
D 0          10:17*

Another sighting?
```

NO

The following display appears if you have a mechanical instrument (disappears when you get within 1grads of the point):

```
          P32    10:17
Aim to point
2001
dHA:199  dVA:197
```

Aim towards the second point 2001 in face 2 and press the A/M key on the back of the instrument.

● or **A/M**

Aim towards the first point 2000 in face 2 and press the A/M key on the back of the instrument.

⬤ or A/M
If switch no 5 is enabled the instrument will automatically switch to face no 1 (servo only).

Press A/M to measure or REG to store without measuring.

In the second case you will be prompted the following:

No meas. made

REG OK?

Press YES or ENT to accept or NO to cancel.

```
D   0/1    10:17*
HA: 100.0021
VA: 102.2815
```

A/M

This is the second measurement towards point 2000 in face 1. Press REG to store the measurement.

```
D   0/1    10:17*
HA: 100.0021
VA: 102.2815
SD: 244.903
```

REG

Press A/M to measure or REG to store without measuring.

In the second case you will be prompted the following:

No meas. made

REG OK?

Press YES or ENT to accept or NO to cancel.

```
D   0/1     10:17*
HA: 106.8589
VA: 101.1072
```

A/M

This is the second measurement towards point 2001 in face no 1 (servo only). Press REG to store the measurement.

Switch to face 2 (automatic if you have a servo instrument).

```
D   0/1     10:17*
HA: 106.8589
VA: 101.1072
SD: 372.290
```

REG

The following display appears if you have a mechanical instrument (disappears when you get within 1 grads of the point):

```
      P32      10:17
Aim to point
2001
dHA:199   dVA:197
```

Aim towards the second point 2001 in face 2 and press the A/M key on the back of the instrument.

⬤ or **A/M**

Aim towards the first point 2000 in face 2 and press the A/M key on the back of the instrument.

⬤ or **A/M**
If switch no 5 is enabled the instrument will automatically switch to face no 1 (servo only).

Here are the differences for the first point (if you have 3 or more points this will be presented as standard deviations, or max/min value if switch 8 is activated). If you wish to view all the deviations press YES or ENT, otherwise press NO. When running the program you will get an error message as soon as the program discovers a difference larger than the limits you have set.

```
 Point 1      10:17*
Diff HA: 0.0011
Diff VA: 0.0004

P33 Robotic Lite

In General

Robotic Lite is a program for collecting large amounts of data for volume calculations, terrain models or hydro graphic applications.

With Robotic Lite you can collect data as a single user. The only requirements are that you have a servo instrument with a tracker and a remote measuring target (RMT). The instrument will follow the RMT and store data with preset intervals. These can either be in form of the time between measurements or the time you have held the RMT still.

The program is divided in two parts:

1. Time & Dist

Enter a time, e.g. 10 seconds and a distance, e.g. 2 meters and the instruments will register data every 10th second, under the condition that you have moved not less than 2 meters from the last point of registration.

2. Stop & Go

Enter a time, e.g. 2 seconds and a distance, e.g. 2 meters and the instrument will register data when you have moved more than two meters under the condition that you have held your target still for not less than 2 seconds.

A useful function in Stop&Go is that the tracklight is automatically switched on when the program is initiated and starts flashing. When a registration is made the flash stops for 2 seconds and you get a confirmation that the registration is done when the flash starts again.

Automatic Search

If the instrument loses contact with the remote target, it will automatically start searching for the target until it regains contact and locks on to it.

Default Settings

When the program is started it will automatically set the instrument in the following modes:

• tracking
• auto centring
• auto search

How to use

Select program 33 and press ENT.

| PRG | 3 | 3 | ENT |

```
Stn estab.  10:17
1 Ok
2 Known Station
3 Free Station
```

| ENT |
Here you can perform station establishment if you wish. In this case we choose not to and press 1 Ok.

```
Stn estab.  10:17
4 Known Station+
```

| 1 |
Choose between 1 Time&Dist and 2 Stop & Go.
In this case we will choose 1 Time & Dist.

```
Select        10:17
1 Time & Dist
2 Stop & Go
3 Coord
```

| 1 |
Enter the time interval that must have passed since the last registration in order to get a new registration.

```
Time&Dist  10:17
Time=10
```

ENT

Enter the distance that you must have moved since the last registration in order to get a new registration.

```
Time&Dist  10:17
Time=10
Dist.=5
```

ENT

Enter the UDS you wish to use for your measurement.

```
Time&Dist  10:17
Time=10
Dist.=5
UDS=
```

ENT

Now you are ready to set a search sector.

Aim the instrument towards the first sector limit and press
ENT.

```
Time&Dist  10:17

Aim to A
Press ENT
```

ENT

Aim the instrument towards the second sector limit and
press ENT.

```
Time&Dist  10:17

Aim to B
Press ENT
```

ENT

The sector will automatically be centred if you loose contact
with the RMT.

Note –   This is only an example UDS.

Key in the Job file in which you wish to store the
registrations.

```
UDS  P3    10:17

Job no=_
```

ENT

Note –   Displayed if Job/Mem is switched on (MNU61)

Select in which memory unit you wish to store the data and press ENT. In this case we select 1 Imem.

```
UDS  P3    10:17
1 Imem ON
2 Xmem OFF
3 Serial OFF
```

[1] [ENT]

Note – Only displayed if Job/Mem is switched on (MNU61)

This is the first step in the example UDS. Enter the first Point number and press ENT.

Set Pno in Auto Incr./Decr.

```
UDS  P3    10:17

STEP1    Set
Pno=1
```

[ENT]

Enter a Pcode for the first point and press ENT.

Set Pcode in Auto Dup.

```
UDS  P3    10:17

STEP2    Set
Pcode=1
```

[ENT]

Enter the signal height for the first point and press ENT.

Set SH in Auto Dup.

```
UDS  P3    10:17

STEP3    Set
SH=1.000
```

ENT

Aim to a point where you want to start the measurement. Walk to the point and the instrument will automatically lock on to the RMT and starts to follow.

```

P39 RoadLine 3D

In General

With program 39, RoadLine 3D, you can measure and setout roadlines in three dimensions.

The program contains routines for storing, checking, setting out, measuring, slope staking and reference point. Two different methods can be used while setting out, 1 conventional radial setting out and 2 orthogonal or rectangular setting out.

Structure

Store

This function is divided in 5 subsections:

6. Roadline- to store the horizontal spread of the roadline.

7. Vertical alignment – to store the vertical spread of the roadline.

8. Cross section definition – to store the different cross sections for the roadline.

9. Cross section – to describe how the different cross sections changes along the road.

10. Camber (Super elevation) – to define how much the road slopes.

11. Layer – to store road layer data.

12. Length – to store length table data (for Swedish railways).

Check

For mathematical check that the data in the areafiles is correct.

Set out

For setting out points along or parallel to the centre of the road.

Measure

For measuring in existing elements and objects that may lie along the roadline.

Slope staking

Function to find out where the ground level intersects with the finished road and to set out embankment sides.

Reference point

Function to set out a point on an optional distance from e.g. a road edge or for measuring in a point and get data for a ref. Pnt. It is also possible to define a boning (guide stake) height.

Store

With This function you store all roadline data, i.e. section interval, centre line offset, section, start- and end points of every element and the type of element. In order to survey or set out a road in P39 at all, a description of the plane, i.e. the horizontal curve, is required. In order to make a complete description of the vertical spread, a height curve, two cross sections (left and right road halves) and two descriptions of the road camber (super elevation) are required. All these tables are described using a number of elements, where the position of these elements is determined by the section (station), one section value that denotes where the element begins and another that denotes

where it ends. The section describes ones whereabouts on the road. The section always describes ones whereabouts on the road in the horizontal plane, even for the vertical descriptions. The elements in the various descriptions are not coupled together and will be dealt with separately in the calculations.

All roadline data will be stored in separate areafiles sorted after type of data according to the following:

Extension	Description
nn	Section interval and layer
nn#1	Horizontal alignment (height profile)
nn#2	Vertical alignment (height profile)
nn#3	Cross sections definition (road profile)
nn#3	Cross sections for right road half
nn#5	Cross sections for left road half
nn#6	Camber* information for right road half
nn#7	Camber* information for left road half
nn#8	Length table, for defining kilometre sectins that aren´t a kilometre (mainly for use on Swedish railways)

*Camber = Super elevation

Requirements

- To work with Program 39 the areafile nn#1 must be stored.

- If you wish to include heights relative to the centre of the road, the areafile nn#2 must be stored.

- If you have defined a cross section and wish to refer the heights to this, the areafiles nn#3, nn#4 and nn#5 must also be stored.

- If you wish to use the camber (super elevation) function, also the area files nn#6 and nn#7 must be stored.

- If you want to use Length tables (mainly for Swedish railways) the area file nn#8 must be stored.

- If you wish to use the layer function, the areafile nn must be stored.

- It is not necessary to define a point code in all files, but it is of great help.

Horizontal Alignment

In order to work with P39 at all, you must have keyed in data for the horizontal alignment of the roadline. This will be stored as section (station), the starting point coordinates for the element and possibly a radius or a parameter for an arc and clothoids. When you store clothoids (spirals) you can choose between keying in A-parameter or to key in radius and length. The roadline must begin and end with a straight element.

The elements on the opposite of a clothoid (spiral) must denote the radius in the conjunction. If this is infinite, the element should be a straight line, otherwise an arc.
The following data is required to describe the different types of elements for the horizontal alignment of the roadline:

Type	Label	Description
Straight	80	Section (Station)
	37	X-coordinate
	38	Y-coordinate
Arc	80	Section (Station)
	37	X-coordinate
	38	Y-coordinate
	64	Radius, Left=-, Right=+
Clothoid	80	Section (Station)
(Spiral)	37	X-coordinate
	38	Y-coordinate
	81	A-parameter

* You can choose between keying in the A-parameter or radius and length.

Example of an areafile with a horizontal alignment:

80=0.000
37=37305.028
38=73505.770
80=68.480
37=37350.638
38=73556.850
64=750.000
80=919.863
37=37480.143
38=74352.784
64=3200.000
80=1803.633
37=37023.901
38=75106.401
80=1803.634
37=37023.900
38=75106.400

Store horizontal alignment

Roadline end?
```

ENT

Vertical Alignment

If you have chosen to include heights in the calculations for roadline, there must be a description of the vertical alignment. The height for the roadline gives a description of the middle line in the vertical plane. A height profile is described by defining height elements with consecutive section values. The end section (station) of an element is identical to the start section (station) of the next element. The elements can be of the type straight, arc or parabola.

To define a straight element only the height and the section (station) at the start- and end points is required. A circular or a parable element also require a start slope. This means that you need to enter a start slope if the previous element type is not a straight line. If a start direction is stated, this should be used. If the coefficient for a parabola is entered as zero, the coefficient will be calculated by the program when it is to be used. This requires that a slope exists both before and after this parabolic element.
The following apply to the figure above:

S=Section (Station)
H=Height
R=Radius of circle arc
C=Coefficient for a parabola, in the form Y=C*X2.

The following data is required to describe the different element types for the vertical alignment:

Example on a areafile with a height profile:

```
80=60
39=16.004
80=80
39=15.657
80=450.568
39=11.581
64=8000
80=746.568
39=13.801
80=1233.983
39=26.474
64=16000
```

ENT

Cross Section

The cross section is divided in 3 different areafiles: #3, which contains all cross section definitions which will be used along the road, #4 which describes how the right half of the road changes along the road and #5 which describes the same thing for the left half of the road.

Cross section definitions (road profiles)

The cross section is defined by a number of breakpoints as Horizontal and Vertical offsets

(difference in height from the Centre line) and possibly a radius. If a point has a radius and there is another point further on, these two points are joined together with an arc irrespective of the direction of the tangent. The tangent direction for the radius in the starting point is defined by the direction for the previous line. If no start direction exists, the arc will get the start direction 0, i.e. horizontal direction. A radius turning upwards shall be given a positive sign and a radius turning downwards a negative sign.
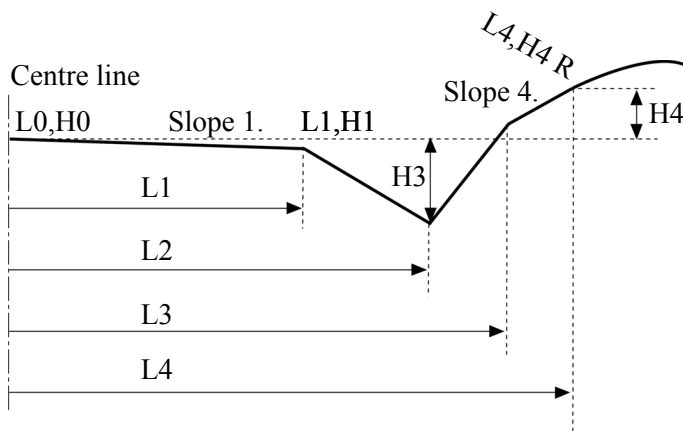

An example of the road profile is shown in the figure above:

L=Distance from the centre line

H=Height difference from the Centre line

R=Radius of circle arc

The number of break points that can be used to describe the cross section is limited to 12 per road half. If the first Centre line offset is not equal to zero, it is assumed that the first point lies at a height of zero on the centre line.

It is not necessary to describe point codes for all point, but the point code is of great help if you wish to search for a specific point by name. Separate tables are used to describe which cross sections are to be used along a certain part of road. These cross section descriptions will only describe one road half only and can then be used to describe both the left and right road halves.

The points described below:

Type	Label	Description
Cross section	88	Cross section number
Straight	4	Point code
	83	Centre line offset. Distance from the Centre line to the point at witch the slope or bend shall be defined.
	85	Elevation. Difference in height from the Centre line.
Arc	4	Point code
	83	Centre line offset. Distance from the Centre line to the point at witch the slope or bend shall be defined.
	85	Elevation. Difference in height from the Centre line.
	64	Radius of the road profile. Requires a tangent direction at the point of the arc if there is no new point to follow. Up=+, Down=-

Example of an areafile with cross sections:

```
88=1
4=1
83=0
85=0
4=2
83=6
85=0.2
4=3
83=7
85=1.0
```

Cross section definitions for left and right road half (profile curve)

Changes in the cross section along the road are stored in two separate area files, one for the right and one for the left side of the road. Reference is made to the predefined profiles in areafile #3. The extension for the right half is #4 and for the left #5.

Sect.=900

Sect.=800

Sect.=80

The program will interpolate a transition if you define where the cross section 1 ends and where the cross section 2 starts.

If you don't Define where the cross section 1 ends you will get a steep transition between cross section 1 and 2.
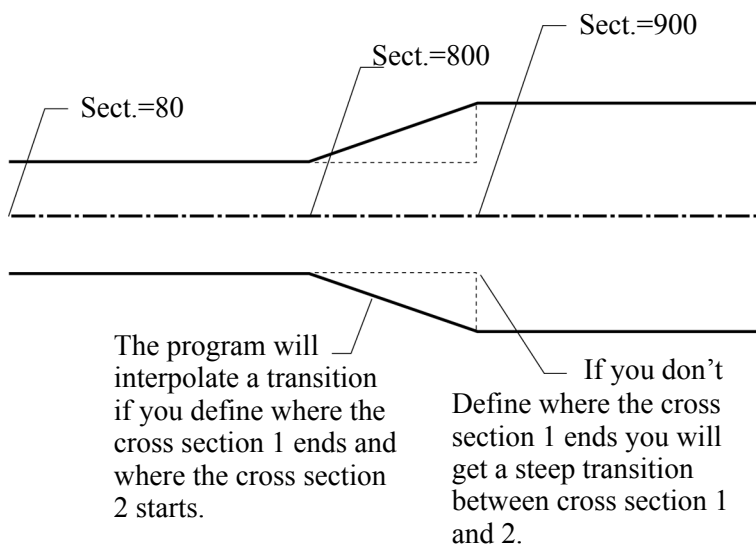

If the beginning or end of the road is undefined, i.e. if the start section (station) for the first cross section is a distance along the roadline or if the end section (station) is defined before the end of the road, the height at the middle of the road will be valid for the whole of the cross section. If there is no cross section defined, the latest profile is valid for the remainder of the road.

The cross section definitions are stored as described below:

Type	Label	Description
Straight	80	Section (Station)
	88	Cross section number
	80	
	88	
	.	
	.	
Profile transition	80	Section (Station)
	88	Cross section number
	80	End of 1:st cross section
	80	Start of 2:nd cross section
	88	Cross section number

Example of an areafile with cross section definitions:

```
80=80
88=1
80=800
80=900
88=2
80=1800
```

Press ENT to define the left road half or NO to exit.

```
        P39  10:17

Left?
```

YES

Continue describing the cross sections for the left half of the road in the same way as the right road half.

Camber

The camber (super elevation) defines the slope of the road. The left and right halves of the road are defined separately. When describing how one half of the road changes along the road, a section (station) and the slope in that section are defined. If the slope will gradually change and the correct slope will be obtained in the next section (station). The slope is stated as a decimal (tangent of the slope angle) and is positive upwards and negative downwards based on the Centre line.

Centre line

V

V=Camber angle
Alternatively, an offset from the Centre line can be entered and the camber (super elevation) defined from this point (see fig. below)

Centre line

V

LO

V=Camber angle
The start section (station) of the next element is the end section (station) of the previous element. The change of the slope within the element will be linear so that it corresponds to the slope of the next element at its start point. If there is no new element, the slope of the last element will be applicable for the remainder of the roadline.

Data for the camber (super elevation) of the road are stored as follows:

Type	Label	Description
Camber about	80	Section (Station)
Centr line	44	Slope, Up=+, Down=-

Type	Label	Description
Camber with	80	Section (Station)
an offset	83	Centre line offset. Distance from the Centre line to where the road profile should slope.
	44	Slope, Up=+, Down=-

Example of an areafile with camber (super elevation) data:

80=80.000
44=0.01
80=180
83=1.5
44=0.03
80=1250
44=0.01
80=1800
.
.

Left?
```

YES

Continue storing the camber data for the left half of the road in the same way as for the right road half.

Layers

The road consists of different layers. At start-up you can key in the layer you wish to work with and what point code the road embankment should have (this to identify the roadway). These layers must be prestored in an areafile. This areafile also contains the layer height. New cross sections will then be calculated continuously. The changes lies in where the roadway intersects with the road embankment. If the roadway has a slope, the height difference from the original cross section will be larger than the layer heights, since the layer runs with the slope of the roadway. If no layers are defined, the unmodified cross

section will be used. A single roadway gives only one point of intersection. The roadway in this example has a slope of the angle v.
Figure 16.15

If the cross section have two embankments, two points of intersection will be calculated.

The point code denotes where the road embankment is, i.e. which element that is the road embankment. The program will search after a point with a given point code and will then lower the element that ends with the road embankment code. If there are more points with the exact code the last point will be used (highways can have two road embankments). The program will then calculate new cross section points for the road embankments. If there are no point code entered or if the entered point code does not exist, it is assumed that the roadway begins at the middle of the road.

The different layers for the road are described as follows:

Type	Label	Description
First layer	80	Start section (station)
	4	Point code for road embankment
	86	Layer ident., name or no.
	0	Layer description, e.g. type of material
	87	Difference in height from the road profil
Next layer	86	Layer ident., name or no.
	0	Layer description, e.g. type of material
	87	Difference in height from the road profil

Length Table

Swedish railways use a special section definition. Each section is described as an even kilometre figure. If a railway track is modified, e.g shortened, the kilometre figures does no longer correspond with the actual track length. This is where the length table comes in use. Here label 80, which in all other RoadLine applications stores section (Sect.) data, is now used for storing the kilometre figure of the length table. RoadLine section is now stored in label 35 instead.

The length table must always be stored with the file extension #8.are. This will be done automatically when keying in length data from a Geodimeter CU. All kilometre data about the length table is stored in label 80. All other Roadline section data (S) now uses label 35 if Length table is used.

When storing a Length table from the Geodimeter control unit you choose alternative 7 Lentos from the Store menu. The keying in of length data can be done in two different ways:

35=3+955.364 or
35=3 955.364

meaning kilometre no. 3 has a length of 955.364 metres. The difference between the two examples is that you can use either a + sign or a space between the kilometre number and the length. If you are loading the length table data from a computer it is best to use the + sign.

Note – If you are going to key in a length table to a Geodimeter CU it is important that you key in this table (#8.are -file) before any other Roadline data. Otherwise wrong labels will be used for the rest of the Roadline calculations. If you transfer length table data from a

computer it doesn't matter when you do this – the right labels are used automatically.

Example of an areafile with length table data:

80=1	for kilometre no.1
89=1002.892	length of kilometre no.1
80=2	for kilometre no.2
89=967.475	length of kilometre no. 2
80=3	for kilometre no.3
89=955.364	length of kilometre no. 2

Store length data

This program is mainly used for Swedish railways.

The length table must always be stored with the file extension #8.are. This will be done automatically when keying in length data from a Geodimeter CU. All kilometre data about length tables is stored in label 80. All other Roadline section data (S) now uses label 35 if Length table is used.

Example of an areafile with length table data:

89=1002.892	length of kilometre no. 1
80=2	for kilometre no. 2
89=976.475	length of kilometre no. 2
80=3	for kilometre no. 3
89=955.364	length of kilometre no. 3
.	
.	

Check

This function mathematically checks that the data in the areafiles is correct. All errors in excess of 20mm horizontally and 10mm vertically will be displayed and the element in which they occur. The control function will also notify slope deviations larger than 0.01, i.e. 1%. Errors which occur due to wrongly keyed in data can be easily rectified with the help of Edit.

Note –   A detected error can depend on either keyed in errors or incorrect design of the roadline.

Select program 39 and press ENT.

```

ENT

Note – *A comparison with the total longitudinal centre*
line measurement of each individual section (station) is
carried out. If the final result gives an error message, one
or more elements contain errors are ≥20mm. Recheck the
roadline and define the element with an error. The element
can be changed with Edit.

Setout

Before any setting out task can be commenced you will
have to do a free or known station establishment. This is
done with Program 20, Stn Est. After having stored the
roadline and thereafter checked that it is OK you can start
with setting out. After keying in section (station) and
Centre line offset values the program will calculate bearing
and distance to these roadline points. Three-dimensional
setting out of cross sections can be performed if heights
have been included in the station establishment.

Storage of control data

The coordinate deviations will represent the differences
between the stored set out point coordinates and the actual
set out point coordinates. This is the basis of the printed out
data sheet which will act as proof of having carried out your
setting out task to within the contract specified accuracy.

These deviations (dN, dE, dELE) are much easier to use than comparing coordinates. If you don't want to store any control data, clear the suggested Job file, and press ENT.

Control data that will be stored are:

Label	Description
80 (or 35)	Section (Station)
83	Centre line offset
39	ELE
86	Layer
87	Layer height
36	Ht.Ofs
40	dN
41	dE
42	dELE

If height measurement is carried out elevations are also stored (staked elevation). If you wish to store other control data you can Configure the user defined output table.

How to combine countdown to zero and radial/right angle offset for setting out

In order to benefit most from the inherent intelligence off your instrument, we recommend that you try to combine the above mentioned setting out methods. Here below is an example:

1. If the setting out data for the first section (station) is OK, press ENT and the instrument will automatically adopt

TRK mode. The display will show the calculated bearing and the dHA.

2. Rotate the instrument until the display shows 0.0000 opposite dHA. With a servo instrument, press ◄►.

3. The instrument is now pointing in the direction of the point.

4. Guide the prism bearer on line with help of the Tracklight.

5. As soon as the prism comes within the measurement beam, you will see dHD=remaining distance to your set out point.

6. If you are in robotic mode, you can easily translate the dHA and dHD values into Radofs. and RT.ofs to the point. When both these values are 0, the correct lateral set out position is reached.
Setout

Select program 39 and press ENT.

Measure

This option enables the operator to localize the section
(station), Centre line and the difference in height relative to
a stored roadline. You simply measure an arbitrary point
and the program calculates the section (station)/Centre line
offset and coordinates of the point. This part of the program
is especially suitable for cross sectioning or localizing an
obstacle when checking a planned section of road.

Measure

Select program 39 and press ENT until this display
appears.

Slope Staking

This option is used to find out where the ground level intersects with the finished road and to set out embankment sides. The heights cannot be deselected, which means that the height curve for the centre line of the road must exist to be able to run this option, (area files nn#1, nn#2, #3, #4, #5 are required).

First you have to select the section (station) to work at. The program will calculate N, E, ELE using C1.Offset=0, and the last point in the cross section. This results in that a reference line will be drawn between these two points in the horizontal plane.

During the survey you will get continuous information about Radofs (C1.Offset), RT.ofs (Deviation from section (station)) and dELE (Deviation from stored cross section). When dELE is zero the Catch point is found. The surveyor can press REG when he thinks he is close enough to the point.

Reference Point

The program can be used to mark out the road design with bonings (guide stakes), i.e. rods with height marks for the road embankments.

This is practical in those cases you have to dig the cut slope or place material to create the fill, when the bonings (guide stakes) have to be located outside the road embankment.

The program can both be used for setting out and surveying reference points along the roadline.

Setout

When setting out the operator enters the point code for the road embankment or the section (station) and centre line offset for the reference point, i.e. first the road embankment and then a distance to where the reference point should be located. See figure 16.16. The program uses the direction of the line sloping from the previous break point in the cross section.

Note – dELE runs with the slope of the roadway.

Figure 16.16
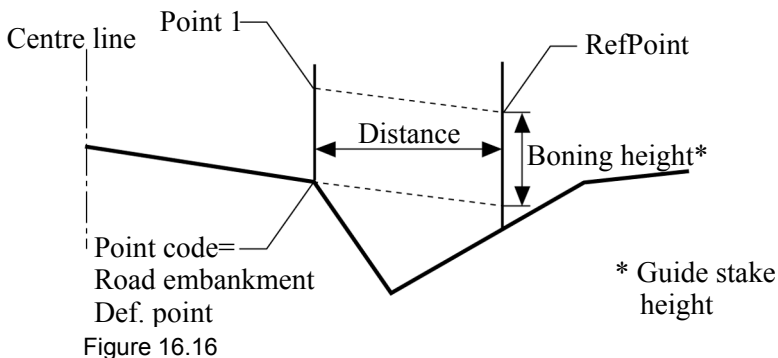

For highways the distance can have to be entered with a negative sign for the road embankment closest the centre line if this lies in the middle of the two road halves. This reference point must be located a bit inside the roadway if you wish to have a correct height, depending on that the program otherwise will use the embankment slope.

Setting out two reference heights on the same rod.

The program also gives you the opportunity to setting out two reference points on the same rod. Default is that reference point 1 indicates one road embankment and that reference point 2 indicates the other. See figure 16.17.
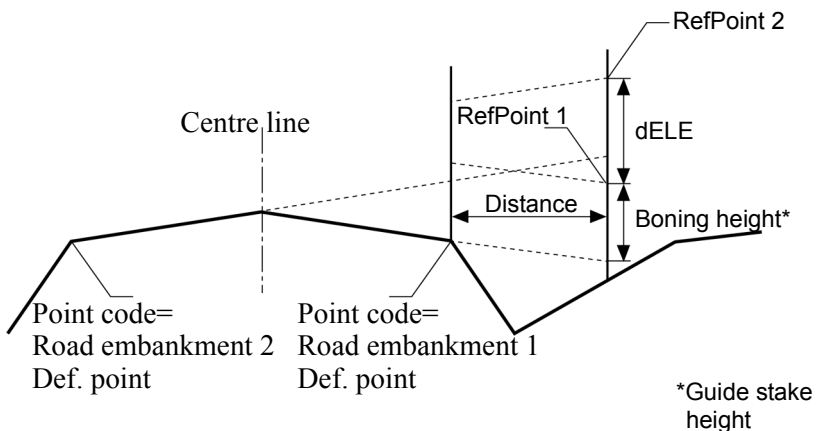

Figure 16.17

Measuring

When measuring the operator enters the section (station) and centre line offset for the def. point. Then you measure a optional number of reference points, see fig. below.

P40 U.D.S.

In General

U.D.S will allow the operator to create own User Defined Sequences for the registration and display of measurement, coding and administrative data. Creation of the sequences is carried out directly from the keyboard of the instrument or transferred from an external device via the serial port.

What advantage can be gained with U.D.S

• It is possible to create and store up to 20 U.D.S´s in the instrument.

• The existence and use of a buffer memory in the instrument allows data to be stacked, which leads to simplified and accelerated data registration.

• It is possible to create and store up to 16 user defined labels (No 84-99) in the instrument.

• Measurement status is always under complete operator control with the help of the automatic display of program prompts in the instrument.

• All labels and values can be duplicated, incremented or decremented automatically. This means that the labels can be registered in a Geodimeter Memory Device (GMD) without even seeing them in the display and without the need to press the ENT key for duplicating and incrementing/decrementing.

Program Generation

Program 40 must be selected in order to create an U.D.S. Once the sequence has been created it is not necessary to run the program 40 in order to access the UDS. It is stored in the memory of the instrument and can be directly accessed by choosing the UDS program number. It will also remain within the instrument until it is deleted or changed by the operator. Program 0-19 are reserved for UDS´s. The sequence is generated by specifying the program No, the order of the desired labels=program prompts and label types. Finally, the label No 79=End must be used to either terminate, loop or link the U.D.S to another U.D.S.

Creation of U.D.S´s

On the next page is a list of Standard Labels. In addition, user defined labels can be set with Program 41. The list and table of label types is not sufficient to explain how and when certain labels and label types are displayed in the instrument during the creation of your U.D.S´s. You simply key in the label´s corresponding number and type in the desired order. In the event of making a mistake during the creation of the U.D.S, the opportunity of correcting the mistake is given by the program asking you to confirm the choice of both label and label type. Your choice of labels and label types is more easily understood when you start to create your own U.D.S´s together with the help of the following examples.

Standard Labels

The label list containing Label 0-83 possess certain functions in Geodimeter CU operation. While creating U.D.S´s, the operator can change the prompt text (P41) but

the function of the label will remain the same. Labels 84-99 are reserved for arbitrary use by the user and can be defined with the program 41, Set Label. Due to the flexibility of the system, almost all label types can be used with all labels. In P0 the only valid are 2, 6, 7, 8. Info 41 is shown if a wrong label type is used.

Label Types

The label type determines the function of the label.

No	Label Type	Description
0	Registration	Collect values directly from the instrument.
1	Prompting label	Enter data manually.
2	Set*	Set values directly in the instrument.
3	Duplicating (auto. or man.)	Display both prompt and the last registered value.
4	In/decrementing (auto. or man.)	Automatic in/decrementing of the previously stored value.
5	Loop/repeat END*	Return to the U.D.S to the first program step.
6	Single Program END*	Return to the U.D.S to P0.
7	Link Program END*	Link the present U.D.S to another U.D.S.
8	View label*	View a value.
9	Call U.D.S-program*	Start another
10	Logon*	Choose memory unit and Job file.

*Can not be stored

0-Registration

Registration of raw and/or calculated values from the instrument. This type of label is chosen when measured and

calculated values can be collected directly from the instrument, e.g. HA, VA, SD, N, E, ELE, HD, VD.

1-Prompting label

Enter data manually after the prompt. The default value of the label will not be displayed.

Note – *For label 21 the only label types that can be used are 1&2*

2-Set

These pre-set values e.g. Label 21=Hor.ref. angle can be set directly in the instrument.

3-Duplicating (automatically or manually)

This label type is used for displaying both the prompt and the last registered value (e.g. SH=0.75). This value can be changed by overwriting or accepted by depressing ENT. The first time you key in the label when you run the U.D.S you are able to choose if the duplication should be automatic or not. If so the next time you enter this program step the label is automatically stored without being displayed.

Note – *If the same label and type exists in UDS that are linked or called upon, the duplication, in/decremention remains.*

4-Incrementing/Decrementing (automatically or manually)

The previously stored value belonging to the same label e.g. Pno=3 is automatically incremented/decremented and can be accepted and stored into instrument either manually or automatically. Displayed values can be overwritten and/or

accepted. The first time you key in the label when you run the U.D.S you are able to choose if the incrementation/decrementation should be automatic or not. If so the next time you enter this program step the label is automatically incremented/decremented and stored without being displayed.

Note –   When using Autodup or Autoincr(decr

Sometimes you are able to change the "invisible" values during a U.D.S sequence by using the function key and enter a new value for the label, e.g. F6, ENT, SH=1.0, ENT.

5-Loop/repeat END

Choice of this label type will automatically return the U.D.S to the first program step after registration of the last data items in the measurement sequence.

6-Single Program END

Choice of this label type will return the U.D.S to program 0 after registration of the last data items in the measurement sequence.

7-Link Program END

Choice of this label type will link the present U.D.S to another U.D.S of the operators choice, allowing the field operation to be registered as one complete sequence. Note that in the linked U.D.S the logon procedure will not be run.

8-View Label

This label type is used when you wish to look at certain values without changing them. Useful if you have Auto dup./Auto inc. Note that the values will only show if you

have a measured distance. Change any value with the function key.

9-Call U.D.S

If you choose this label type you are able to start another U.D.S program as a subroutine. When the subprogram is finished you return to the next step in the original U.D.S. You can call upon U.D.S´s in max. 4 levels, otherwise you will get Info 47.

Note – The labels that are unique in the subprogram will not be reset when you restart the original U.D.S program.

10-Logon

Choose in which Job file you wish to store the data when you make a registration. This label type can only be accessed when starting the U.D.S from computer. In order to register anything a logon step must be run through otherwise Info 10 will appear when trying to register, link or call.

Is this how you would like to set up your own program?

Prog. No	Prompts used in U.D.S	Label No	Label Type	Remarks
1				**Program generation of general project/Job data program**
	Logon		(10)	YES
	Operat	53	3	Value seen, accept or key in new
	Date	51	3	Value taken directly from instrument.
	Time	52	3	-"-
	Temp	56	1	Prompted for and keyed in
	Press	74	1	-"-
	End	79	6	Single program, return to P0
2				**Program generation of inst.stn/Ref.Obj data program**

	End	79	7	Link this program to Prog. 3.
3				**Program generation of survey point data program**
	Pno	5	4	Incr/decr value seen, accept or key in new.
	Pcode	4	3	Duplicated value seen, accept or key in new
	SH	6	3	-"-
	HA	7	0	Value taken directly from instrument
	VA	8	0	-"-
	SD	9	0	-"-
	END	79	5	Prog. loops back to first step in this sequence=Pno

The programs (sequences) on the previous page are only examples of how you could design your field data recording sequences. Normally the surveyor is aware of the different types of projects in which he or she shall be involved and it is therefore possible to design in advance those programs which he or she may need and store them in instrument. In the event of some unusual survey task turning up for which time is no stored program, it is a case of just entering the required sequence into instrument directly in the field.

How to use

Select program 40 (U.D.S).

```
STD  P0    10:16

HA=392.9095
VA=102.8955
```

PRG **4** **0** **ENT**

You are now ready to begin with creation of the U.D.S´s 1, 2 and 3 on the previous page. First key in 1 and ENT.

```
        P40   10:17

Prog.no=
```

1 **ENT**

Enter a name for the U.D.S –program. Press the ASCII-key to enter an alphanumerical name (max 16 characters). Press ENT when ready.

```
        P40   10:17

P1
Name=_
```

ENT

Note – If the program already exists this question appears. Press YES to view the program or NO and Yes to delete it.

```
      P40   10:17
Prog.no=1
View?
```

Press YES or ENT to put log on first in the program.

```
      P40   10:16

Log on?
```

YES

Step 1 is Label No for operator. Key in 53 and ENT.

```
      P40   10:17
P1 Step no 1
Label no=_
```

5   **3**   **ENT**

Label type=duplication type (3) as it is often same operator who uses the instrument daily. Key in 3 and press ENT.
If you leave the line blank you will return to the previous menu.

```
      P40   10:17
P1 Step no 1
Label: Operat
Type=_
```

3   **ENT**

Here you have a chance to change your mind e.g. if you made a mistake with either label choice and/or label type. In this example we press YES.

```
      P40   10:16
P1 Step no 1
Dup: Operat
Ok?
```

YES

Label no for Date. Key in 51 and ENT.

```
      P40   10:16
P1 Step no 2
Label no=_
```

5   **1**

This value will be taken directly from instrument as you have chosen label type 0, you will not need to key in the date. Key in 0 end ENT.

```
      P40   10:17
P1 Step no 2
Label: Date
Type=_
```

0   **ENT**

Press YES to accept the label.
Carry on in this manner using the filled in example on page 17-8. If you loose track as to where you are in your

sequence you can easily see this by checking on the step No.

```
         P40   10:16
P1 Step no 2
Meas: Date
Ok?
```

YES

When you come to step No 6 which is the point at which you wish to terminate the sequence, do as follows:

This is equivalent to choosing Label No 79=END. Press only ENT.

```
         P40   10:21
P1 Step no 6
Label no=_
Ok?
```

ENT

This is the label type for a single nonlinked sequence. Key in 6 and ENT.

```
         P40   10:21
P1 Step no 6
Label: Special
Type=
```

6

Key in YES to accept the label.

```
        P40   10:21
P1 Step no 6
Single
Ok?
```

YES

You are automatically returned to the program 0. In order to be able to continue with sequence creation it is necessary to choose Program 40 before starting with Program 2.

```
STD  P0    10:21

HA:32.9960
VA:48.9088
```

U.D.S Examples

The design of U.D.S´s is of course dependent on how your existing software accepts data recorded in CU. Formatting possibilities must exist within the system so as to be able to present the recorded and transferred data in a suitable lay out. This may entail some small changes to existing data transfer programs or even the necessity to create some new ones.

Recording of raw data

Prog 1 - General

Label	Text	Type

79	END	5

Choice of Storage Unit

If you press YES or ENT at the question "Log on?" when you create your U.D.S-program, you will be able to choose in which memory unit and in what Job-file all data will be stored when registering.

Note – If this logon routine is not included Info 10 is shown and no registration can be done even if pressing the REG-key.

Create a subroutine

Look at page 17-14. Program 1 is a general U.D.S-program that are useful whenever you want to start a U.D.S sequence. Instead of manually initiating this program you can call upon this program from any of your other U.D.S programs. Simply press ENT and choose type 9, Call (Program 1), at the second step in your U.D.S-program. This means that when you start your U.D.S program, e.g. Program 2, the program automatically initiates program 1, the general U.D.S-program. When the general program is run through you are returned to the next step in program 2.

Enter program 40 and choose to create program 2. Answer YES to logon. At step 1 press ENT.

```
        P40   10:21
P2 Step no 1
Label no=_
```

ENT

Choose label type 9, Call, and press ENT.

```
        P40   10:21
P2 Step no 1
Label: Special
Type=_
```

```
  9     ENT
```

Here you enter the program you want to call. In this example we choose program 1 and press YES (ENT).

```
        P40   10:21
P2 Step no 1
Label: Special
Call=_
```

```
  1     YES
```

Accept the first program step with YES or ENT. Press NO to re-enter. Continue with the following program steps.

```
        P40   10:21
P2 Step no 2
Label no=_
```

Now lets start program 2 and see how it works.

Start program 2.

```
STD   P0  10:21

Program=_
```

```
  2     ENT
```

First the program runs through the logon procedure and you choose in which Job file you wish to store the data.

```
UDS  P2  10:21

Job no=_3
```

ENT

Choose in which memory unit you wish to store the data.

```
UDS  P2  10:21
1: Xmem off
2: Imem off
3: Serial off
```

2 **ENT**

Now the program calls upon program 1.
Enter the general parameters…

```
UDS   P1  10:21
Step: 2    Store
Date=2001.0211_
```

YES

This is the last step in program 1.
When you press ENT you will return to step 2 in program 2.

```
UDS   P1  10:21
Step: 5    Store
Instno=69000_
```

```
ENT
```

The program will continue step by step to the end of the
program.

```
UDS   P2  10:21
Step: 2    Store
Stn=_
```

P41 Define Label

In General
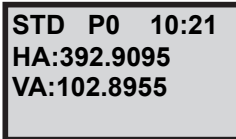

With program 41 you can define label no 84-99. Program 41 – Define Label is included in the following program:

**Program 41
Define Label**
**Program 40
U.D.S**

How to use

Turn the instrument on and disengage the dual-axis compensator with function 22.

Select program 41 (Define Label).
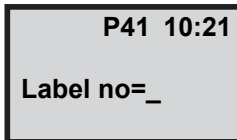

```
STD  P0   10:21
HA:392.9095
VA:102.8955
```

`PRG` `4` `1` `ENT`

Choose any label between 90-109. In this example we choose 90 and press ENT.

```
         P41  10:21

Label no=_
```

`9` `0` `ENT`

Here you can see any old definition that may exist. Press the ASCII-key to adopt ASCII table and key in the appropriate characters, e.g. 71 68 84 32 78 79 (colour) and press ENT.

```
         P41  10:21

Change to=F90
```

`✉` `ENT`

When you are ready press only ENT instead of keying in a label no. You will now return to program 0.

```
       P41  10:21

Label no=_
```

P43 Enter Coordinates

In General

With program 43 you can carry out storage of known coordinates. These known values are stored in an Area file. The data contained in these AREA files will take the format Pno, Pcode, Northing, Easting and Elevation and must be keyed in manually. Coordinates are entered with up to 7 positions and 4 decimals.

Transfer of point coordinates and elevation data banks between computer and Geodimeter CU is carried out with program 54, File transfer, or by sending serial commands. See Geodimeter CU general for more information.

As the total number of Area files is unlimited (device memory capacity is only limitation), the same point numbers can be used as long as they are stored in different Area files. Same point numbers can be stored in the same Area file, however, it is always the point nearest the beginning of the file which is recalled for use in Station Establishment –P20 and SetOut – P23 calculations. If a particular point has to be updated in an Area file, this can be done with Edit, if the software is installed in your instrument.

Program 43 – Enter coordinates is included in the following programs:
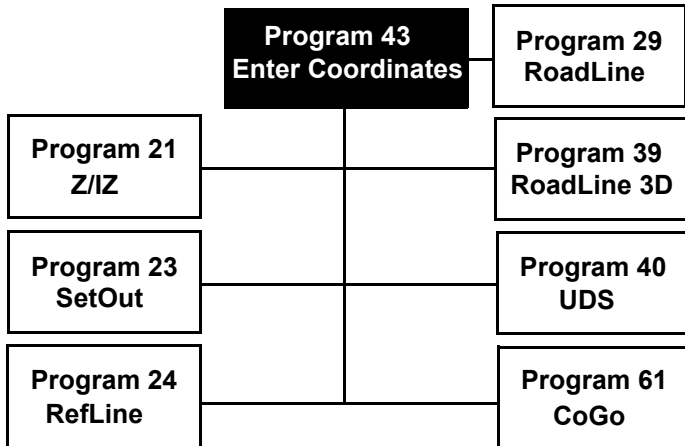

Program 43 Enter Coordinates	**Program 29 RoadLine**
Program 21 Z/IZ	**Program 39 RoadLine 3D**
Program 23 SetOut	**Program 40 UDS**
Program 24 RefLine	**Program 61 CoGo**

How to use

Switch on the instrument and go through the Start procedure until the instrument is in theodolite mode.

Select program 43 (Enter Coordinates).

```
STD  P0   10:16
HA:392.9095
VA:102.8955
```

[PRG] [4] [3] [ENT]

In which device do you want to store the point coordinates. In this example we choose 1 Imem.

```
Sel device  10:17
1: Imem
2: Xmem
```

[1]

Key in the name of the Area file in which you wish to store the point coordinates and height values. In this example we key in 25 and ENT.

```
        P43    10:16

Area=_
```

[2] [5] [ENT]

Do you want to store heights? In this example we choose to do so. Press YES (ENT) to accept or NO to cancel.

```
                    10:16

HT measure?
```

YES

Key in the first point number you wish to store in the Areafile. In this example we key in 1 and ENT.

```
        P43    10:17

Pno=_
```

1   **ENT**

Here you have an opportunity to enter a Pcode for the point. The program will propose the last Pcode entered. Accept it, key in a new or leave it blank.

```
        P43    10:16

Pno=1
Pcode=_
```

1   **ENT**

Key in the Northing value of point number 1 and press ENT.

```
       P43    10:16
Pno=1
Pcode=1
N=3456789.012
```

ENT

Key in the Easting value of point number 1 and press ENT.

```
       P43    10:16
Pno=1
Pcode=1
E=1234567.789
```

ENT

Key in the height of point number 1 and press ENT.

```
       P43    10:16
Pno=1
Pcode=1
HT=123.890
```

ENT

Press YES to store point number 1 or press NO to cancel.
In this example we press YES.

```
       P43    10:16
Pno=1
Pcode=1
Store?
```

YES

Key in the next point number or press only ENT when you are finished. In this example we press ENT.

```
       P43    10:16

Pno=_
```

ENT

You are now returned to program 0.

```
       P0     10:16

Temp=20.0_
```

P45 Pcode

In General

Pcode provides the operator with the opportunity of calling upon a point code library which can be directly created from the instrument keyboard. After Pcode library creation and keying in of the Pcode number, the appertaining Pcode name will be displayed either for acceptance or rejection and thereafter recording.

How do I create my very own point code library

This is done simply by choosing the program No 45=Pcode. It then simply becomes a task of keying in the numerical value of the point code followed by its equivalent alpha or alphanumerical title. The instrument automatically adopts the ASCII mode for this purpose and you consult the ASCII table in your instrument user manual for the keying in of the alpha/alphanumerical codes.

Pcode numbers range from 1-254; if Nos above this range are chosen INFO 31 is displayed. The equivalent alpha point code can contain up to 16 characters; in cases where 16 characters are required, the prompt "Text=" will disappear from the display during the creation of the point code.

Maximum of stored points

The maximum number of characters which can be stored in the point code library is limited to 800. In other words if all the point codes stored in the library have a maximum number of characters of 16, there would be enough room for 50 point codes. However, as most point codes are abbreviated, the storage room of 800 characters should provide the operator with enough storage place for all point

codes her or she will require for storage of detail point code numbers during e.g. a tacheometric exercise.

Note – *The numeric value of the point code is stored, not the title.*

Activation/deactivation of Pcode

After the installation of Pcode in the instrument, it can be activated or deactivated with the help of menu 6.1-Switches.

```
MNU    6    1
```

```
Set         10:16
Targ.test     on?
AIM/REG      off?
Pcode         on?
```

This means that if Pcode is set to ON the keying in of a numerical point code in e.g. an U.D.S, will automatically result in the equivalent alpha/alphanumerical point code being displayed in the instrument; its correctness is confirmed by pressing ENT. If wrongly keyed in the point code can be overwritten without having to clear the wrongly chosen one with the CL-key.

There are however some occasions where operators are very experienced and have been working with only numeric Pcodes on field cards for years. On this occasion the Pcode switch can be switched off. The instrument will always adopt the last chosen ON/OFF mode at switch on. The status of the switch can also be seen when keying in one´s first point code number in a U.D.S, i.e. if the point code´s equivalent alpha title is seen in the display after keying in

the numeric code and pressing ENT, then the switch is set to ON.

Note – *In order to correct any wrongly keyed in point code alpha title, so that it corresponds with its numerical point code value, it is necessary to recreate it with the help of Pcode.*

The changing and deletion of wrongly keyed in data and the insertion of a new can of course be carried out with EDIT, if you have access to this software in the instrument.

Auto dup, auto incr/decr label types

When using the Auto dup/auto incr/decr feature with Pcodes in U.D.S´s, wrongly keyed in values can be changed without the prompt and its respective value being duplicated in the recording device. This is done by using the F4 function; this function must be used before pressing the REG key. In cases where ordinary Dup and incr/decr label types are used, use of F4 function will result in the Prompt and its respective data being added to the already in-buffer memory recorded data. In other words, the point code data will be duplicated. This can be erased and corrected with EDIT later, if you have access to that particularly software. This applies to all data which has been wrongly recorded while using the Auto dup, Incr/Decr in the connected recording device. So even if you have pressed the REG key, it is never too late to erase and/or change and correct wrongly recorded point code data. Correction of wrong and entry of new Pno and SH values can be treated in the same manner.

How to use

Switch on the instrument and go through the Start procedure until the instrument is in theodolite mode.

The instrument´s station has been established. Select program 45 (Pcode).

```
STD  P0   10:16

HA=392.9095
VA=102.8955
```

PRG **4** **5** **ENT**

Choose the numerical value of the pcode to which you wish to give an alpha title. In this example we choose 1 and press ENT:

```
      P45    10:17

Pcode=_
```
1

The instrument adopts the ASCII mode, key in the complete alpha title or abbreviated alpha title of the point code. In the example we key in 87 65 76 76=WALL (see the ASCII table).

```
      P45    10:17
Pcode=
Text=
ASCII=
```

ENT

Continue to create your Pcode library in this way until you have stored all the alpha titles you need. When you are finished, press ENT to return to P0.

```
    P45      10:16

Pcode=2
```

Pcode in U.D.S and other programs

You have now stored, in the memory of the instrument, the necessary alpha titles of most types of survey detail you require to survey in during your tacheometric task. As soon as you have established your instrument over the survey station at which the survey measurements shall be carried out you can take advantage of the alpha and alphanumerical Pcodes stored in your Pcode library. When in the U.D.S, the sequence prompts for the point code corresponding to the type of survey detail which is to be measured and stored, all you do is key in the relevant Pcode´s numerical value. After its display, confirmation of its correctness is done by pressing ENT on the instrument keyboard. Storage into Geodat or any other external device is finalized by pressing the REG key of the instrument after the point has been measured.

Note –   *The numeric value of the point code is stored, not the title.*

Pcode can be entered directly in the following programs:

```
                              ┌─────────────────┐
                              │                 │
                      ┌───────│     U.D.S.      │
                      │       │                 │
                      │       └─────────────────┘
                      │       ┌─────────────────┐
                      │       │   Program 22    │
                      ├───────│   Angle Meas    │

                              └─────────────────┘
```
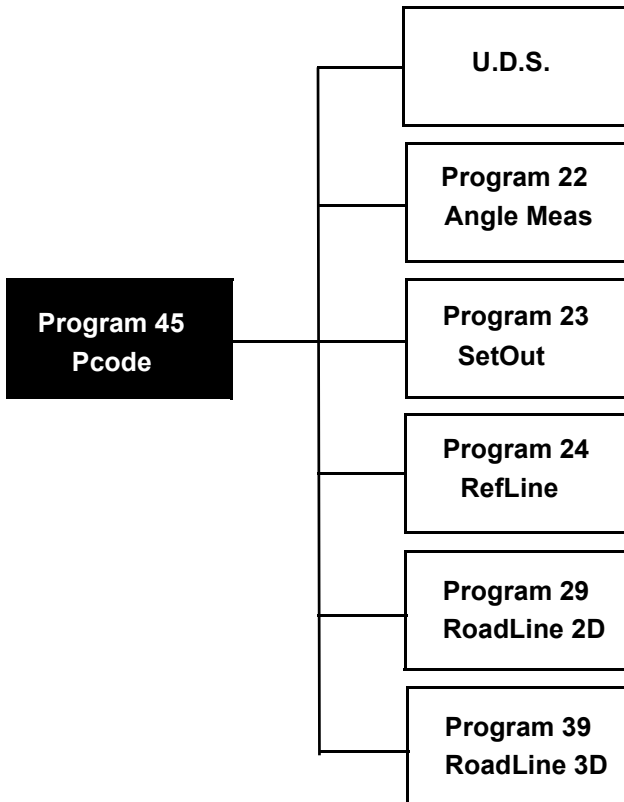

P54 File Transfer

In General

Connect the two units with the appropriate cable and switch them on. The instructions below describes how to transfer files from the Control unit to the Station unit's internal memory:

How to use

Operation at the source unit

Choose program 54

| PRG | 5 | 4 | ENT |

Choose from which device you want to transfer files. In this example we choose 2 Imem.

```
From        16:12
1. Imem
2. Xmem
3. Serial
```

| 1 |

Here you can choose what type of file you want to transfer:

1. A jobfile 2. An areafile or 3 A U.D.S-file.
In this example we choose 1. A jobfile.

```
File        16:12
1. Job
2. Area
3. U.D.S.
```

| 1 |

Key in the name of the file. In this example we key in Job=1.

```
                    16:12
From Imem
Job=
```

```
 1
```

To which device are you going to send the chosen file/s from the source unit. Here we choose 3. serial.

```
To          16:12
1. Imem
2. Xmem
3. Serial
```

```
 3
```

Enter new serial parameters or accept the current. Here we accept the current with enter.
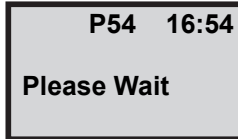

```
      P54     16:12

COM=1.8.0.9600
```

```
ENT
```

Note – Prepare the target unit before accepting the serial parameters for a successful file transfer.

The file/s are sent via the cable and the display shows.
"Wait" during the transfer and you will then exit program 54.

```
P54   16:54

Please Wait
```

*Note –   If info 19 appears during a file transfer that means
that the file transfer was not successful. In that case you
should run the file transfer again and look for where it fails,
that is when info 35 (Data error) will show. Then check
your file for any errors and if possible correct them with the
editor.*

Operation at the target unit

Chose program 54

```
PRG   5   4   ENT
```

From which device are you going to send files to the target
unit. In this case it is 3. Serial.

```
From        16:12
1. Imem
2. Xmem
3. Serial
```

```
3
```

Enter the serial parameters which must be same as the serial parameters at the source unit.

In this example we accept the current with ENT.

```
P54        16:12

COM=1.8.0.9600
```

ENT

What type of file should the transferred files be saved as:

1. Job, 2. Area or 3. U.D.S.

In this example we choose 1. Job since we are transferring a Jobfile.

```
To         16:54
1. Job
2. Area
3. U.D.S
```

3

The unit is now ready to receive. Start the transfer from the source unit.

```
To         16:54

Please Wait
```

3

P55 Job/Mem

In General

Program 55 will enable the operator to change job name and select memory device to store the job. When a program is started the operator is prompted to key in the job name and select memory if Job/Mem has been activated in MNU 6 1. If Job/Mem has been deactivated in MNU6 1 then program 55 offers a fast way to change job name and/or memory device

How to use

Select program 55.

```
STD  P0    16:12

HA:  22.9253
VA: 108.5321
```

PRG **5** **5** **ENT**

The program will suggest the latest job name press ENT to accept or key in a new name for the job file.

```
       P55    16:12

Job=
```

ENT

Select in which memory you want to store the job file. Press ENT to return to program 0.

```
       P55    16:12
1: Imem on
2: Xmem off
3: Serial off
```

ENT
